ALL NEW with this edition of EEM

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $5.00 for postage and handling. An invoice will accompany your System.

Don't waste any more time. Get organized now!

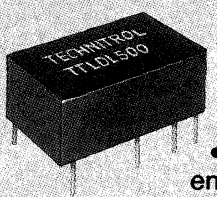
Circuit timing.

Why adjust it when you can perfect it?



Let's say you've just designed the fastest, tightest digital circuit you've ever seen. But it needs a super delay line to tie into your overall scheme. Something special. Certainly high-performance.

You need Technitrol. For leading- or trailing-edge timing of any logic-based circuit.

• Only Technitrol can give you a selection of lumped-constant active delay lines with 5 ns to 2000 ns delay times that are ±1 ns or ±1% repeatable over −55° to +125°C, at rated voltage input ±10%. That's full voltage and temperature compensation!

(We aren't just telling you they perform this well—we'll put it on the part if you wish.)

• Our programmable delay lines, up to 100k ECL, give you a selection of up to 15 different delay times per module, differing by as little as 500 ps.

• Technitrol chip-carrier delay modules enable tighter board stacking and the use of vapor-phase reflow technology.

If you're really serious about quality and performance, you'll appreciate our meticulously balanced designs that produce consistent lows and highs for both positive- and negative-going logic signals. And our low failure rates are unheard of elsewhere. Who else can give you all this?

You'll find the same performance and reliability in all of our military- and commercial-grade products. Our toughest customers demand this. You should, too.

IF YOU'RE A DEMANDING, PICKY, IMPATIENT PERFECTIONIST, WE'VE GOT THE BOOKS FOR YOU.

The tougher you are as a customer, the happier you'll be with us. Start with our products. Because we design, manufacture and stock one of the most extensive lines in the industry, chances are you'll find exactly what you need in either or both catalogs. And if you don't, we'll design circuitry or customize a package to your exact specifications. So, stock or custom, there's no need to look any further than Allen Avionics.

Then there's reliability. Every single component we deliver has been individually tested and is guaranteed to be within the electrical and physical parameters specified. Regarding price and delivery . . . we're competitive on every item and lower on many. More important, whether it's a product in stock, a custom order or a prototype, you'll have it when you need it, and that's a promise.

If your standards are a little too high for other suppliers, send for our Delay Line and/or Filter catalog, or better yet, give us a call. We handle tough problems for tough customers. With ease.

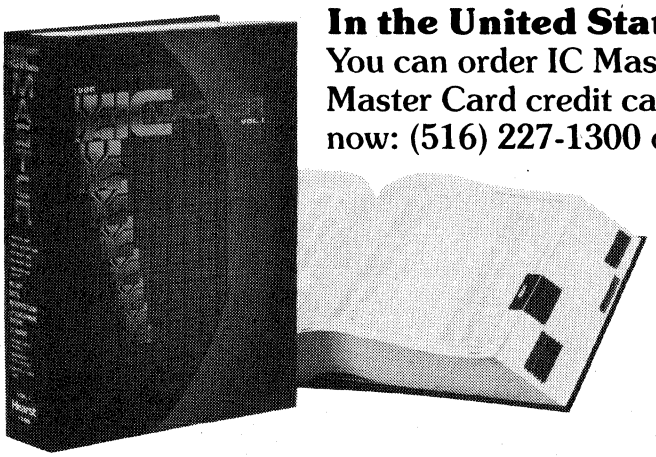
IC MASTER BELONGS ON YOUR BOOKSHELF

If you don't have your own IC MASTER, you can obtain your own copy by ordering now. Write for your own copy or order by telephone as described below.

IC MASTER is a two-volume set of technical data carefully organized to direct the engineer to the integrated circuits and related products that are closest to his specific needs. It is the surest and fastest way to find the optimum devices to answer an engineering design requirement. By ordering now, you won't have to borrow or search for IC MASTER the next time you need it.

Typical Use of IC MASTER
Can an engineer find out who makes a 256K dynamic RAM with an access time of 120 nanoseconds or faster in less than 30 seconds? He can if he turns to the Memory section of IC MASTER and looks for the 256K organization (words and bits per word) that he needs. Because each device is listed in order of access time, he can easily determine the devices that satisfy his speed requirements.



In the United States only:
You can order IC Master simply by charging it to your VISA or Master Card credit card. To place your order (USA only) call now: (516) 227-1300 or (408) 249-6800.

DIGITAL DELAY OSCILLATOR SERIES 0458

This delay oscillator works as an asynchronous start-stop free running clock pulse generator. The oscillator is intended as the primary control element of state machines used in digital controllers. The assertion of the input (high) trigger causes the oscillator to free run, producing TR thru T4 clock pulses for as long as the input is asserted. Oscillation ceases when the input trigger is negated.

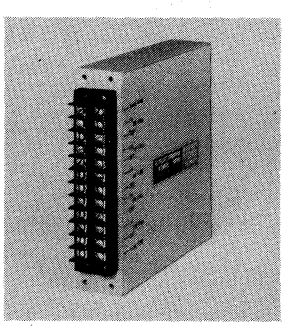
NOTES
1. Continuously variable output, high impedance tap.
2. Variable output via a coarse control 10 steps of 0.4 μsec and a fine control of 10 steps of .045 μsec.
3. Delay adjustment programmable by remote control.
4. Variable output via discrete screw driver slotted switches.
5. No high impedance tap necessary.

PRECISION AUDIO DELAY LINES



Over the years Control Electronics has developed a special skill in precise audio delay lines, including sectional balanced and unbalanced units ranging into the millisecond region. The sectional line terminals are arranged so as to conveniently enable the user to externally connect and disconnect the various sections for proper delay.

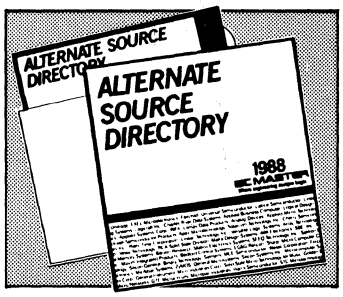
HEARST ENGINEERING SOFTWARE

ICMASD...IC Alternate Source Directory

If you've used the IC MASTER, you know what the Alternate Source Directory is. Engineers tell us that it's one of the most valuable sections of the Master. The Alternate Source Directory...ASD...is now available in floppy disk form.



The electronic ASD is FAST! Just ask a question and the answer pops up in a split second.

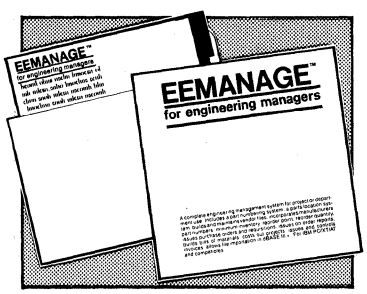
The electronic ASD is FLEXIBLE! You can add ICs and you can add comments.

You can add part numbers, prices, technical notes or anything else you like. You can customize the ASD to fit your needs and the needs of your company.

Order the 1988 Alternate Source Directory for your AT, XT or compatible. We'll send you two floppies and a very simple piece of printed documentation. Download the floppies and you're in business. All you need is a hard disk.

EEMANGE...for engineering managers

Developed by the publishers of EEM/ Electronic Engineers Master, EEMANAGE is a software program designed to make life easier for engineers and engineering managers.



EEMANAGE does many things: 1. Develops Bills of Materials 2. Assigns Part Numbers logically 3. Manages Engineering Inventories 4. Issues Purchase Requisitions 5. Relieves Engineering Inventories 6. Manages a Parts Storage System 7. Issues Engineering Change Notices 8. Interfaces with dBaseIII+ Programs.

EEMANAGE is completely menu driven. It is simple to understand and operate. Any competent secretary can be up and running on EEMANAGE in minutes.

Order EEMANAGE for your AT, XT or compatible. We'll send you one floppy and brief, very user friendly documentation.

The basic price for ICMASD or EEMANAGE is $149.50 each and includes floppy disk(s) and complete program documentation.

For immediate shipment you can order ICMASD or EEMANAGE on your VISA or MasterCard credit card simply by calling Marie Botta at (516) 227-1300.

PDE TYPE 6-BIT ULTRA HIGH-SPEED PROGRAMMABLE DELAY LINES

PDE types are ultra high-speed, programmable delay lines wherein ELMEC's ultra high-speed delay lines (Tr < 500 ps) and ELC 100K series are combined.

A combination of ELC 100K's ultra high-speed performance, ELMEC's high-resolution delay lines and attached high-precision adjustment system provide higher precision to any variable step.

Also, radiating system is well designed so that high reliability is assured.

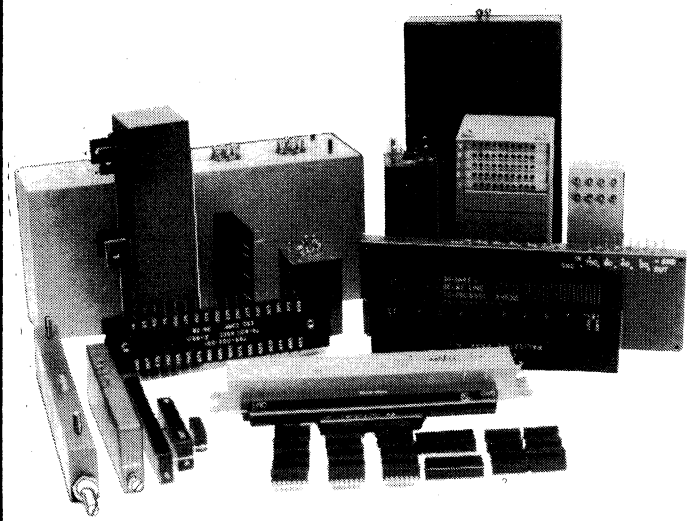
DELAY LINES

• SINCE 1953 •

30 years of experience and expertise in delay line design and manufacture. The following pages list a large sampling of the industry's current demand for short delay lines both analog and digital types, but ESC is still the most chosen source for delay lines ranging up to several hundred milliseconds and with delay-to-rise time ratios up to 250:1. In addition to lumped constant types, also manufactured are distributed constant, voltage variables and mechanically variable devices.



ESC ALSO DESIGNS AND MANUFACTURES TYPICALLY:

Equalized, Precision tapped, low distortion, beam forming delay lines for sonars, scanners, transponders, sorters, Tacan and DME, etc.

Programmable and mechanically variable Delay lines for the TV Broadcast industry, including video cable simulators and voltage variable Delay Lines.

Proven design, manufacturing capabilities, and facilities encompassing all quality levels dictated by MIL-I-45208 and MIL-Q-9858A.

The proven design and manufacturing techniques are employed by ESC for all levels of reliability required for the military, satellite or space probes and encompass quality levels dictated by MIL-I-45208 & MIL-Q-9858A as applicable.

ESC has participated in many hi-rel programs over the years starting with Apollo, Minuteman and the Viking Probe and currently in such programs as Trident, F15, F16, B-1, Space Shuttle and Peacekeeper.

ESC maintains an extensive continuous program of life testing on the new generation of military TTL compatible hybrid delay lines. This program has accumulated data indicating exceptionally high reliability for both commercial and military applications.

ESC has expanded its testing capabilities for the new generation of TTL, DTL, ECL, FAST, and CMOS Compatible hybrid delay lines. Testing is accomplished by computer controlled, state-of-the-art equipment, which is capable of recording leading and trailing edge delay time, rise and fall time, all within seconds. In addition, and at comparable speeds, the hybrid delay line DC parameters such as Icc, Vi, Vol, Voh, Ii, Iil and Iin are swiftly measured and recorded if necessary.

The highly accurate and high speed testing system allows all parameters to be tested on a 100% basis guaranteeing the highest quality product to our customers.

At the side is a sample computer read-out exhibiting the leading and trailing edge delay and rise and fall times of three operating levels for a TTL hybrid delay line.

Over the past two decades, **Kappa** has optimized, packaged, and critically tested literally thousands of specific variations of several hundred different passive and hybrid delay lines: fixed tapped, continuously adjustable, and electrically trimmable (varactor-tuned) lines; over virtually the complete signal spectrum from control (subaudio), through audio, sonar, RF, HF, and a wide variety of pulse rates widths and duty cycles.

Typical design families include:

- PRECISION SONAR DELAY LINES (Series A) 500 μsec to 10^6 μsec ±1%; linear to ±0.05%
- LOW-DISTORTION LINES (Series D) Delay-to-Risetime Ratio: 50 max; Bandwidth: 50 MHz max
- MINIATURE CONTINUOUSLY VARIABLE DELAY TRIMMERS (Series TT) Size: 1/4 Cubic Inch; up to 120 ns; resolution ≤0.25 ns.
- SUPER-η™ DELAY LINES (Series H) Embody New Design Principle Providing the Highest Efficiency yet Obtainable in Lumped-Constant Delay Lines.
- MINITRIM DELAY LINE (Series MT) Resolution Less Than .5 ns and Delay Ranges Up to 300 ns.
- VIDEO BROADCASTING DELAY LINES (Series BC) Widely Used in the Most Demanding Color TV Applications in American and European Systems.
- TRANSPONDER/TACAN/DME (Series C) Designed to Meet the Requirements of MIL-D-23859 and to Withstand the Most Rigorous Military Environments.

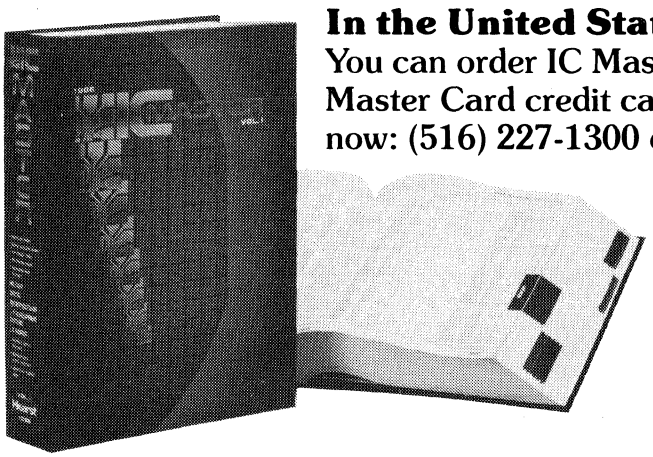
IC MASTER BELONGS ON YOUR BOOKSHELF

If you don't have your own IC MASTER, you can obtain your own copy by ordering now. Write for your own copy or order by telephone as described below.

IC MASTER is a two-volume set of technical data carefully organized to direct the engineer to the integrated circuits and related products that are closest to his specific needs. It is the surest and fastest way to find the optimum devices to answer an engineering design requirement. By ordering now, you won't have to borrow or search for IC MASTER the next time you need it.

Typical Use of IC MASTER
Can an engineer find out who makes a 256K dynamic RAM with an access time of 120 nanoseconds or faster in less than 30 seconds? He can if he turns to the Memory section of IC MASTER and looks for the 256K organization (words and bits per word) that he needs. Because each device is listed in order of access time, he can easily determine the devices that satisfy his speed requirements.



In the United States only:
You can order IC Master simply by charging it to your VISA or Master Card credit card. To place your order (USA only) call now: (516) 227-1300 or (408) 249-6800.

Or mail your order to

AUTO-INSERTABLE & SURFACE MOUNT TTL 10 TAP DELAY MODULES

FEATURES

- Low profile auto-insertable package, also gull-wing or "J" bend surface mount versions
- 14 lead transfer molded epoxy packages
- Schottky TTL buffered input/output
- Taps at 10% increments of total delay

The low profile auto-insertable and surface mount series of TTL delay modules offered by Rhombus Industries Inc. have been designed to provide precise tapped delays with all necessary drive and pick-off circuitry in a single package. The modules are compatible with all TTL integrated circuits and include compensation for propagation delays. All inputs and outputs are Schottky-type and require no additional components to achieve specified delays.

All versions are fully compatible with standard automatic handling equipment. The surface mount devices can be used in either infrared or vapor phase manufacturing processes, and are designed to withstand automatic solder and cleaning processes. Devices are offered in delays from 50 to 300 nanoseconds. Delay time and tap tolerances are shown in the tables below. Temperature coefficient of delay is typically better than +800 ppm/°C over the temperature range of 0° to 70°C.

The devices accept either Logic "1" or Logic "0" and will reproduce these levels at the output without inversion. Each module has the capability of driving up to 20 TTL loads with a maximum of 10 TTL loads on any one tap.

These devices are designed to meet or exceed all applicable environmental requirements of MIL-D-23859, MIL-STD-883 and MIL-STD-202.

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $5.00 for postage and handling. An invoice will accompany your System.

Don't waste any more time. Get organized now!

ACTIVE DELAY LINES (ADL-H/EDL SERIES)

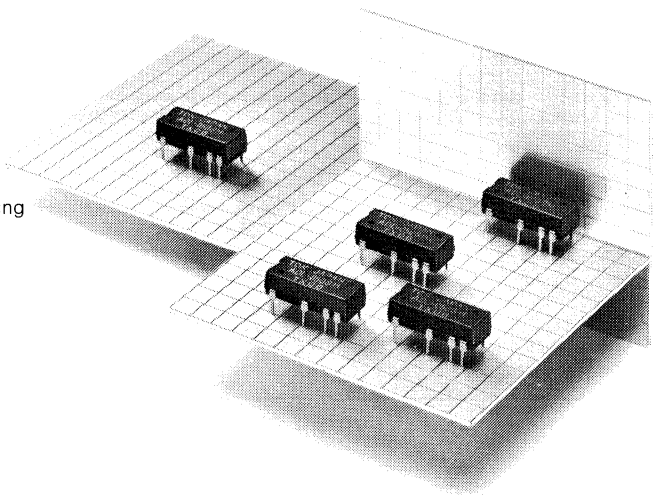
TDK Active Delay Line ADL-SH/EDL Series are 5-output (EDL: 2-output) lumped constant type delay lines with built-in TTL logic elements (Schottky type). In addition. TDK multilayer chip inductors are employed as inductance elements, and by combining these with multilayer chip capacitors, a compact, high reliability construction has been obtained.



Features

- Contained in DUAL-IN-LINE type package.
- Excellent quality due to transfer molding using high quality resin.
- A low height of only 5.08mm maximum is realized as a result of using TDK multilayer chip inductors and multi-layer chip capacitors.
- Since a TTL IC is built in, waveform shaping is not required.
- IC automatic insertion equipment can be used.

Technitrol delay-module performance is widely known and highly regarded by both military and commercial users. Many models, such as the ultrastable STTLDL shown below, are unmatched in performance and reliability. Designed primarily for high-performance applications, the STTLDL has very high output stability over a wide range of temperature and input-voltage variations. Increasingly, the STTLDL is selected as a commercial prototype for brand-new designs — and then written in because of the superior perfcrmance it offers.

We invite you to consider the STTLDL as an example of Technitrol capability. Its technology is an integral part of all our delay modules — including low-cost products — shown on this and the following pages.

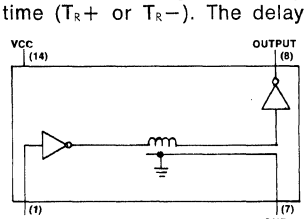
TECHNITROL TTL DELAY MODULES

Technitrol TTL delay modules are designed to be used directly with super-high-speed TTL, standard TTL, and DTL logic circuits. They interface with little or no additional requirements. They can be cascaded in various combinations to get any delay without degrading output rise time (T_R+ or T_R−). The delay rise-time ratio (T_D/T_R) of individual modules is very high (approximately 50:1) and improves with cascading modules. Output rise times of each module are independent of input rise times up to 50 ns. All Technitrol delay modules are transfer molded, not potted, assuring maximum reliable operating lives.

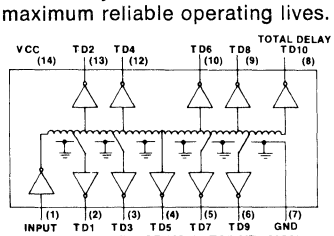
SINGLE-OUTPUT DELAY MODULES

Single-output modules are available with 5 to 500 ns delays. Buffered. Only the pins to be used are supplied.



10-TAP DELAY MODULES

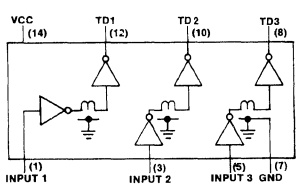
10-tap delay modules are available with 50 to 500 ns total delays. Dimensions same as standard 5-tap, with the exception of 5 additional pins. See connection diagram.



CONNECTION DIAGRAM 10 TAP VERSION

TRIPLE-OUTPUT DELAY MODULES

Technitrol TTL buffered delay modules are available with three individual inputs and outputs in delays from 5 to 250 ns per delay.



TTL SQUARE-WEAVE OSCILLATORS

Available in 2 to 100 MHz frequency range. Frequency tolerance ±2%. Dimensions same as Technitrol standard 5-tap delay module.

- 6 ± 1.5 ns propagation delay from input to output.
- −55 to +125°C temperature range available.
- For Schottky TTL, TTL, and low-power Schottky TTL circuits.
- ±10% supply voltage tolerance.
- Minimum input-pulse width only 5 ns.

Surface-mount components

The requirement for surface mounting need not supersede that of high performance and reliability. The surface-mount delay lines, pulse transformers, and Manchester encoder/decoders described below give the same outstanding performance provided by their non-surface-mountable counterparts, industry's finest.

Technitrol surface-mount passive delay lines and active, internally buffered delay modules demonstrate good balance of design, resulting in the opportunity to choose both leading- and trailing-edge circuit timing.

These designs, followed up by well controlled manufacturing, produce reliably-performing products in the 10s, 100s, or 1000s. Our low failure rates are unheard-of elsewhere.

For isolation and impedance-matching tasks in data interfacing, SCR triggering, balun line conversions, and other applications, find out why Technitrol pulse transformers are so often called on for the tough jobs.

Technitrol surface-mount Manchester encoder/decoders are available for any data rate from 1 Mb/s to 50 Mb/s (including 16.8696 Mb/s) from minor adjustments in one good design — not from complete redesigns.

***NEW HIGH-REL MATERIAL* — Technitrol surface-mount components are now available in a new high-rel material that provides maximum reliability, a higher temperature coefficient and better stability.**

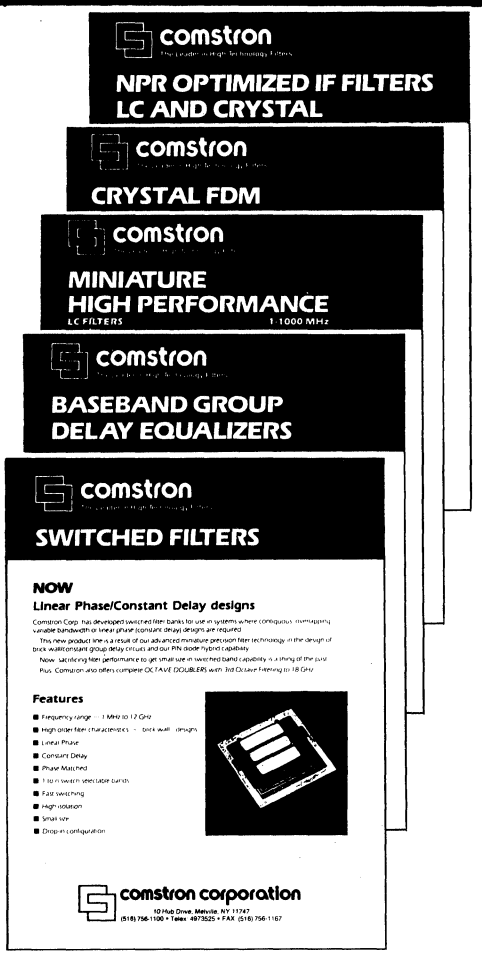
TECHNOLOGY " + " FILTERS

The Extra Edge in Systems Performance DC to 1 GHz

Comstron has developed optimum frequency or time domain filters to produce near theoretical system performance. These technology + filters are available as catalog items or custom tailored to your needs.



Design

Comstron has implemented modern network synthesis and physical realization techniques to the point where highly reliable, compact, LC and crystal filters are available — quickly and economically. Proprietary computer analysis, modeling, and optimization programs efficiently arrive at near-optium solutions to spectral, time domain, and stochastic problems. The Company's Enhanced Synthesis Program (ESP). Filter Optimization Program (FOP) and Parameter Optimization Program (POP) provide design parameters for systems oriented functions. Requirements for group delay equalization, wide band arithmetic symmetry, x/sin x amplitude correction, corrected Nyquist filters, phase compensation, and time domain response designs are routinely and efficiently handled.

Test

The Company's commitment to excellence is evident in its extensive test facilities. Automatic computer based network analyzers cover the frequency range from dc to 1.3 GHz with full plotting and printer output capability. Parameters which are automatically measured include amplitude response, phase response, group delay, and return loss. Time domain testing can also be performed to verify impulse response or response to complex waveforms.
Computer directed environmental testing allows unattended measurements of performance over temperature on a production basis. Comstron's proprietary Automatic Filter Test (AFT) programs permits rapid and accurate generation of acceptance test procedures as well as full documentation and data files when required.

Quality Control

Comstron maintains a Quality Control Department that ensures compliance with MIL-I-45208A and MIL-Q-9858A when applicable. Microscopic inspection, controlled environment, material control and traceability, solder training programs, and strict configuration management all contribute to producing an exceptionally reliable product.
The quality control program is continuously monitored. Over the years since its inception, Comstron has assembled a dedicated, conscientious staff whose pride of workmanship and customer loyalty is the keynote of the Company.

SERIES R FILTER

The R series dual T section RFI power line filters provide premium performance at moderate cost. They are well suited for low impedance loads where noisy RFI environments are present. At frequencies as low as 150 KHz the R series has an insertion loss as high as 45 DB. The control pulsed, continuous and/or intermittent interference insuring protection of your equipment from power line noise in addition to protecting the line from equipment noise. The R series is an ideal replacement for Pi type filters while incorporating the "value added" concept. Pi filters have used large capacitors to eliminate low frequency RFI, resulting in high line-to-ground leakage current. The R series dual T type provides extremely low leakage current without deterioration of insertion loss characteristics.

Q SERIES — RFI Powerline Filter For switching power supply noise suppression

The Q series of RFI power line filters has been developed specifically for switching power supplies and is designed to be all the power line filtering required to control conducted emissions down to 10 kHz. High attenuation is provided for both line-to-line and line-to-ground interference throughout the frequency range, with no graduation of performance due to the large peak current drawn by switching power supplies. * 3 EQ models only

T SERIES

The T series provides superior common-mode and differential-mode attenuation in a small package. These filters are a size and cost effective choice for very noisy equipment that must meet the emission limits of FCC Parts 15 and 18, or VDE 0871 A-level. In many instances, these filters can bring equipment into compliance with VDE 0871 B-level. This series meets the low leakage current requirements of SEV, VDE portable equipment, and (120 volt) UL544 non-patient medical equipment. * 3/6/10 AMP models

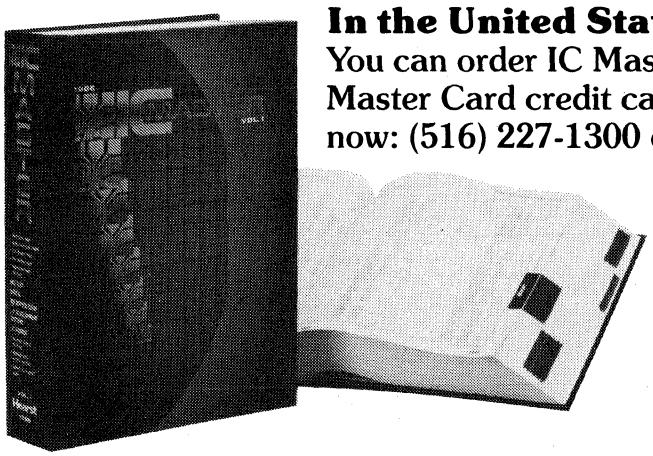
IC MASTER BELONGS ON YOUR BOOKSHELF

If you don't have your own IC MASTER, you can obtain your own copy by ordering now. Write for your own copy or order by telephone as described below.

IC MASTER is a two-volume set of technical data carefully organized to direct the engineer to the integrated circuits and related products that are closest to his specific needs. It is the surest and fastest way to find the optimum devices to answer an engineering design requirement. By ordering now, you won't have to borrow or search for IC MASTER the next time you need it.

Typical Use of IC MASTER
Can an engineer find out who makes a 256K dynamic RAM with an access time of 120 nanoseconds or faster in less than 30 seconds? He can if he turns to the Memory section of IC MASTER and looks for the 256K organization (words and bits per word) that he needs. Because each device is listed in order of access time, he can easily determine the devices that satisfy his speed requirements.



In the United States only:
You can order IC Master simply by charging it to your VISA or Master Card credit card. To place your order (USA only) call now: (516) 227-1300 or (408) 249-6800.

Or mail your order to

HLC-700 SERIES

FEATURES

- Highpass, Lowpass, Bandpass and Band Reject
- Standard Or Custom Versions. 1.0 MHZ to 1.0 GHz.
- Power Ratings to 1.0 KW
- Manufactured to Mil Stds.

EAGLE HLC-700 series LC filters are compact, high performance filters. Careful design, the use of silver plated inductors and porcelain capacitors, and modern production techniques yields sharp cutoff with low passband insertion loss. These filters are constructed to be tough, both electrically and mechanically. Cases are heavy gauge nickel plated brass. Connectors and other hardware are also brass or stainless steel. This type of construction leads to filters that are both ESD and EMP resistant. The solder sealed case keeps out foreign materials while insuring the RF integrity of the package. HLC-700 filters are suitable for direct to antenna connection for receiver inputs or medium power transmitter outputs. Connectors of various types are available for easy interconnection to your system. The following table lists some of the filters available in this family:

ESC HYBRID/THICK FILM COMPONENTS TO YOUR SPECIFICATIONS!

ESC offers a hybrid/thick film packaging capability as a service that you can employ in repackaging your discrete components into one single configuration. Our standard techniques used are as follows:

1. All components are mounted to a ceramic substrate.
2. Capacitors, when applicable, are COG (NPO) ceramic chip types with tolerance range from ±1% to ±10%.
3. Resistors are thick film and screened on the ceramic substrate and laser trimmed to ±1% tolerance.
4. Inductors are custom designed for economy size and reliability and are wound on low permeability powdered iron magnetic cores exhibiting temperature coefficients of 100 ppm/°C. Inductance tolerances available are from ±1% to ±10%.

This service is not limited to simple L/R/C networks but also more complicated assemblies such as L/C filters, both unbalanced and balanced configurations.

ESC complies to MIL-I-45208 and if required can perform burn-in temperature cycling and other screening tests when required.

THE NUMEROUS ADVANTAGES TO THIS SERVICE ARE:

- 1. Reduction in PC board real-estate.
- 2. Reduced assembly time.
- 3. Reduction in inventory parts count.
- 4. Use higher level of quality components.
- 5. Component values are not restricted to standard values but are available in an infinite range.
- 6. All final products are 100% functionally tested.
- 7. Low overall cost over discrete components.

JMK INCORPORATED filters

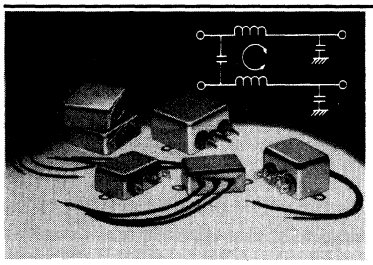
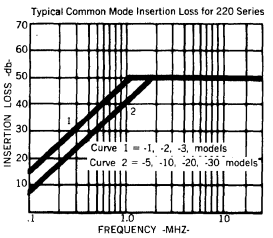
UL, CSA, VDE

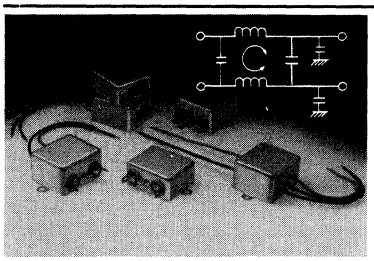
JMK has the filter just right for your power application. Whether it has to do with audio systems, lab test equipment, medical equipment, printers, power converters, video displays, modems, processors, cash registers, pinball machines, televisions, aircraft power supplies, or whatever your specific application may be, we have the filter.



220 Series

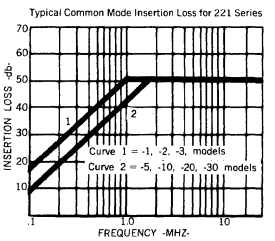
The 220 series is designed to give excellent filtering of "common mode," line-to-ground interference on computer-peripheral and other electronic hardware. Line-to-ground interference is the most common interference experienced and is generally the major source of "interference caused" malfunctions.

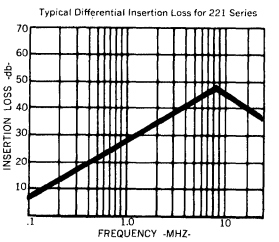


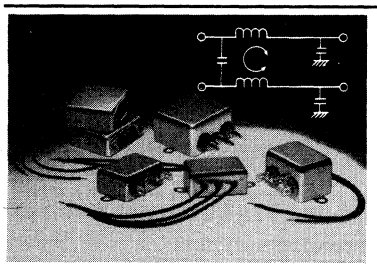


221 Series

The 221 series has the same "common mode" performance as the 220 series but the circuit has been modified to give substantial "differential mode" rejection of noise caused by switching transistors and power supply diodes.

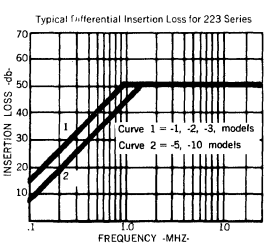


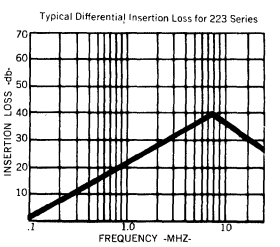


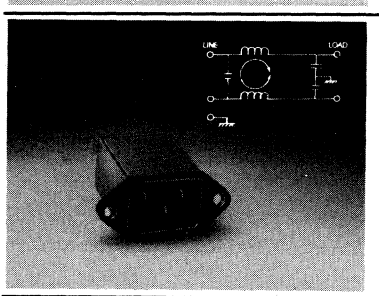


223 Series

The 223 series in intended as an economical compromise between the 220 and 221 series. This filter has the same "common mode" performance as the 220 model with approximately one-half the differential attenuation of the 221 series.

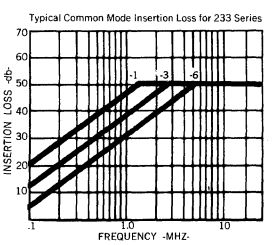


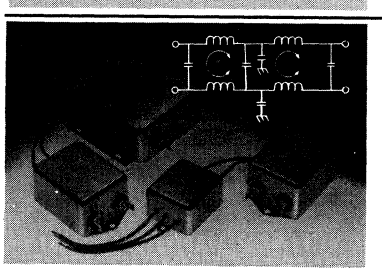




233 Series

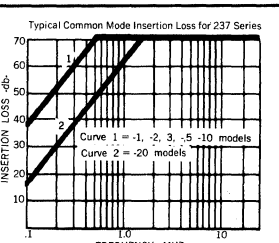
The 233 series filter is a compact filter with an integral IEC connector. This filter gives effective line-to-ground insertion loss and has low leakage current to meet VDE, SEV and other safety organization requirements. If you want an integral filter and connector ask your representative or contact the factory. Many of our other filters can be made available with the IEC connector.

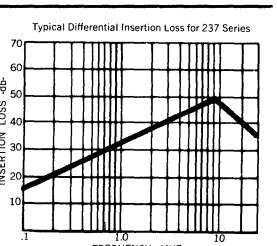


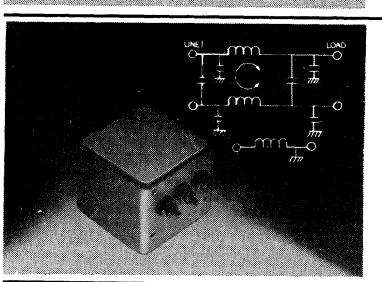


237 Series

This series is a high performance package where filtering requirements are more stringent than those associated with the 220 or 221 series. This package incorporates very high attenuation of both "common mode" and "differential mode" interference yet the cost for such attenuation is moderate.







283 Series

The 283 series is a compact single phase high current filter. This filter is rated for 20 and 30 amps and has good common mode and differential mode insertion loss. This filter has a ground coil for high frequency ground isolation which may be included or omitted as desired.

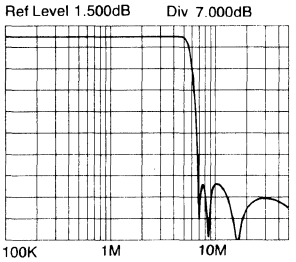
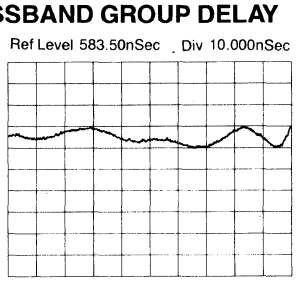
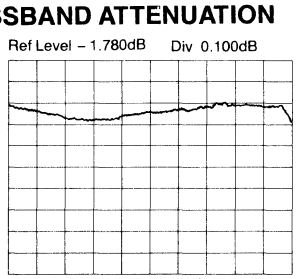
ATTENUATION vs. FREQUENCY



PASSBAND GROUP DELAY



PASSBAND ATTENUATION



Designed and manufactured to meet the stringent requirements of video analog and digital systems, KR Electronics' group delay equalized low-pass filters are optimized for performance and size.

The three primary criteria for video applications are sharp transition, constant group delay and flat passband. The graphs at the left illustrate the typical response of a MDV8B500 filter. The filter makes a transition from the end of the passband to >45 dB at a shape factor of 1.4. To practically eliminate phase distortion, group delay equalizers are used to achieve constant group delay (< ± 10 nsec) over the entire passband. These filters also exhibit flat amplitude response (< ± .1 dB) up to the cutoff frequency. This performance is available in a miniature, low profile, PC board mountable package.

These filters are ideally suited for anti-aliasing in A/D and D/A applications. Various levels of attenuation are available for different resolutions. For filters used after D/A conversion, Sin(X)/X shaping of the passband is available.

KR Electronics has a strong background in custom design and manufacture. This gives you the flexibility to specify the frequency, shape factor and package configuration that meet your particular requirement.

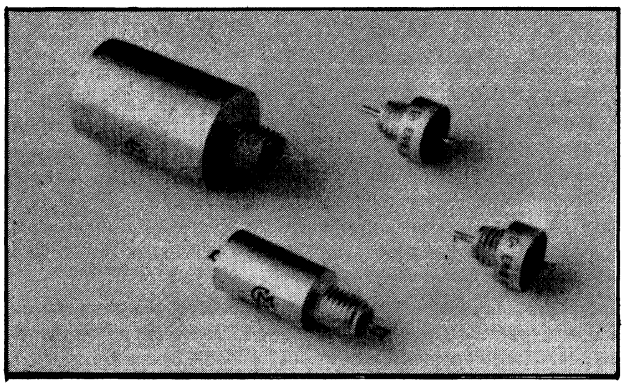
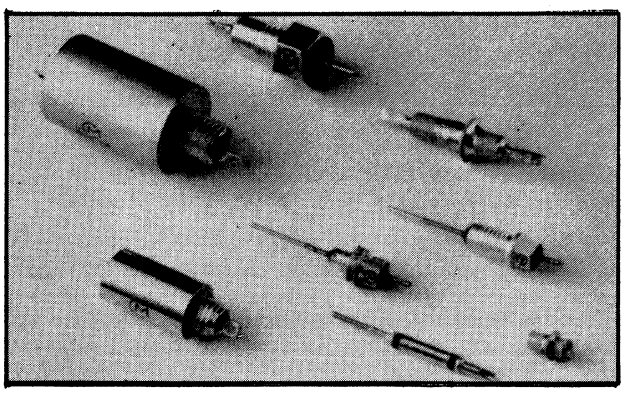
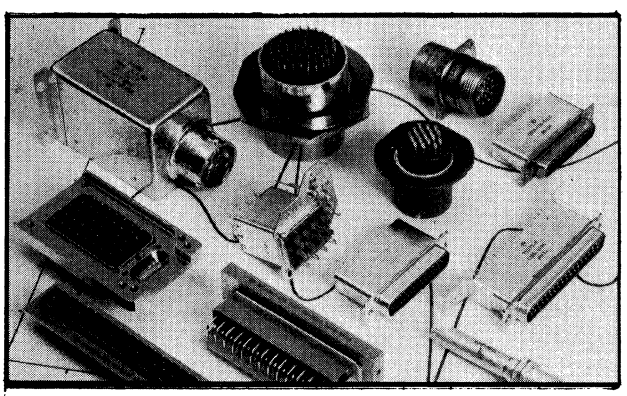
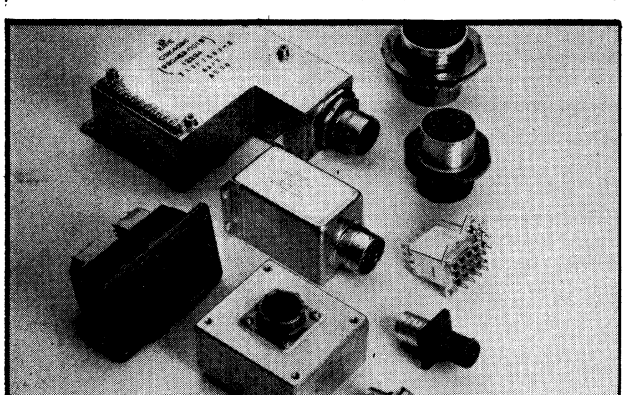
EMI/RFI Filters/Filter Connectors

MURATA ERIE NORTH AMERICA









Murata Erie is an EMI Filter manufacturer dedicated to the design and production of high quality EMI filters and filtering systems for the electronics industry. In-house facilities include a complete design and manufacturing capability for EMI filters, a Quality Assurance System meeting or exceeding the requirements of MIL-Q-9858 and DND-1015, and a fully equipped and qualified calibration laboratory. To compliment this design and manufacturing expertise, Murata Erie has a complete Customer Service and Customer Engineering staff that offers comprehensive customer application assistance.

The products described on this page represent a cross-section of Murata Erie's filter capabilities. Many more styles and variations are also available to meet virtually every industrial and MIL application requirement. For additional information or application assistance, contact your local Murata Erie Sales Office or our Customer Engineering Departments in Trenton, Ontario, Canada at 613-393-2581.

Coaxial Filters

Murata Erie offers a wide selection of coaxial feed-thru EMI/RFI filters in T, L, and P circuit configurations. These filters meet MIL-F-15733. Also offered is a complete line of coaxial AC line filters for 125/240 VAC systems from 60 to 400Hz. A wide selection of units meeting MIL-F-15733 are also available in the line.

Pi Section Filters

Murata Erie produces an extensive range of Pi section EMI filters in both bushing mount and solder in styles. Consisting of two grounded capacitors around a series inductor, the Pi filters enable the designer to realize 60dB/decade of attenuation across the desired range of frequencies. It is the multiple element nature of the Pi circuit that results in the sharp gradient of the insertion loss curve from the cut-off frequency up. A wide selection of filters meeting MIL-F-15733 are included in this line.

Filter Connectors

Murata Erie having been the leader in the EMI filter industry for 50 years, has now expanded its filter-connector line in order to offer you the same unsurpassed high quality product in many connector packages. Because of Murata Erie's unique position in this market, that of being the only filter connector house having complete in-house ceramic capability, we can offer combinations of capacitance values and voltage ratings available no where else in the industry.

Filter connectors meeting MIL-C-26482, 38999, 81659, 83733 and 24308 are included – also, "Tempest" power line filters.

Custom Designed Filter Networks

Murata Erie specializes in developing sophisticated circuit designs and creating high component density packaged networks. Our engineering design teams analyze individual customer problems, design specific components or networks to solve the problem, build prototypes and test the complete system.

The reliability of every component and network is assured by a comprehensive battery of tests performed under carefully controlled conditions. Then, in-line prototype techniques further validate component performance prior to volume production.

These technical support activities permit Murata Erie to respond to customer needs promptly and efficiently with postitive performance engineered into the customer's system.

EMI-GUARD with 3 Terminal Varistor-Capacitor

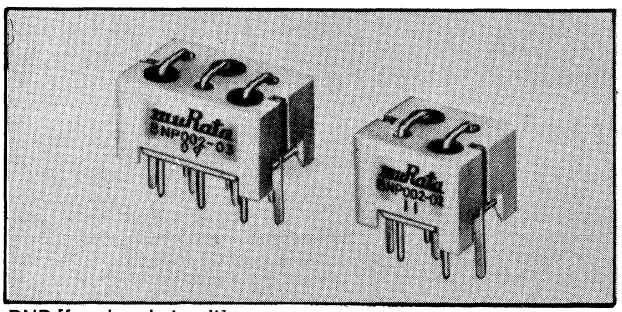
EMI-GUARD DSS710, D 223S 12-22

The DSS710 EMI-GUARD uses a new capacitor element which provides the varistor function. This varistor-capacitor not only works as a bypass capacitor but also lets most high-voltage surges flow to ground.

The varistor-capacitor used in the DSS710 EMI-GUARD has a 3-terminal structure so that its high frequency functions are substantially better than those of conventional capacitors. Furthermore, it is combined with ferrite beads to form a T-shaped filter circuit that more effectively dampens noise.

The DSS710 EMI-GUARD efficiently removes quick-rising surges and high-frequency noise above 50 or 60 MHz which conventional capacitors and varistor-capacitors are incapable of removing.

Varistor capacitors are used even where EMI filters fail. They are self-healing and effective in circuits having 500–600V impulses.

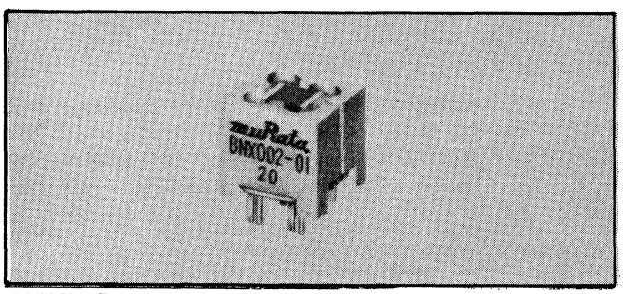


BNP [for signal circuit]

Block Type EMIFIL®, BNP/BNX Series

Murata Erie's new block type EMIFIL BNP/BNX Series completely eliminates noise from extremely wide frequency bands. The BNX is perfect for use in DC power circuits, while the BNP is ideal for eliminating noise in logic signal circuits. Both are designed to perform superbly—the result of Murata Erie's wide expertise in the fields of through-type barrier layer capacitors, monolithic chip capacitors and bead inductors.

Each blcok contains a number of compact EMI-suppression filters. In addition, the input/output terminals and the grounding terminal are aligned in the same direction, thus permitting fast and easy assembly on any type of P.C. board.



BNX [for DC power supply]

Signal Line Noise Filter, NFV510 Series

The NFV510 series signal line EMIFIL is an efficient noise suppression filter for high-speed digital signal lines where the frequencies of signal components and noise components are very close.

Murata Erie has combined its superior inductor and capacitor technologies with a unique circuit configuration to realize outstanding noise suppression effects.

NFV510 Series EMIFILs meet the noise suppression regulations of FCC, CISPR, and other agencies.

L/C filters are specified in either the Frequency or the Time Domain. Frequency Domain filters emphasize passband ripple and stop-band attenuation. Butterworth, Chebyshev, and Elliptic Function filters are included in this category. Time Domain filters emphasize the time-amplitude domain characterized by phase linearity and constant group delay. Bessel, Gaussian and other linear phase designs are included in this category.
Low-pass, Hi-pass, Band-pass, and Band-reject designs are available in frequency ranges to 400 MHz. Special Low-pass and Band-pass filters have been achieved featuring notches placed at desired frequencies in the stop-band to further attenuate undesired or spurious signals.
For those filter applications where size and weight are the prime consideration, PICONICS offers a line of chip inductor-capacitor designs. Low-pass, High-pass, and Band-pass types mounted on alumina substrates are available. For example, a three pole filter has been assembled on a .250 in. sq. substrate. Overall package height is determined by orientation and size of the chip inductors. To meet environmental military applications, filter networks are packaged in metal shielded cases with r.f. connectors. Printed circuit and end terminals are also available. Epoxy encapsulation is optional. For units assembled with chip inductors and capacitors on alumina/ ceramic substrates, shield covers are optional. This is usually determined by the environment surrounding the device.

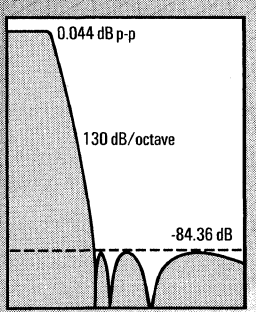
Friendly new 1 MHz filter

We have a tradition of leading the way to higher frequency filters.

Now, we announce the industry's first 1 MHz bandwidth filters for programmable use. 80 dB/octave attenuation. Time delay superior to Bessel. It's the friendly advance you've asked for.

New friendly elliptics as sharp as 130 dB/octave

Precision was first to offer elliptics with 80 dB/octave attenuation. Now, we're first to add the sharper option of 130 dB/octave for frequencies up to 255 kHz.



Passband ripple is 0.044 dB p-p, and there's 1° phase match up to the cutoff frequency.

Filters are offered in a wide variety of types that you can mix or match within the 16 card capacity of the new Precision 6000 mainframe. Filters come one, two or four channels per card, depending on resolution and other performance features.

Friendly is extending your choice to match needs and budget precisely.

New friendly open door policy on configuration

Not only can you mix various types of filters, you can also add a variety of preamps, postamps and gain-ranging amplifiers, as well as frequency band translators. And to that, you can soon add such input conditioning as strain, charge and voltage.

It's a simple matter to select the hardware building blocks. It's simple to configure their control for convenient operation. It's also simple to modify and add to your system as requirements change.

The Precision 6000 starts system friendly and stays system friendly.

WORLD'S FIRST SYSTEM FRIENDLY CONDITIONERS

Now, you can integrate filters, amplifiers, frequency band translators and other signal conditioners *your* way in *your* system about any way *you* wish. You can do it as never before. We've gone beyond user friendly and created system friendly. That's new Precision 6000.

Now, custom systems at friendly off-the-shelf prices

Yesterday's custom systems are configured with today's standard hardware and software. Yesterday's unaffordable becomes very affordable today. Tomorrow's new instruments will operate in today's mainframe. That's system friendly with futures.

Friendly language brings down old barriers

No longer do you have to be concerned about the programming idiosyncrasies of a number of instruments. All Precision 6000 asks is familiarity with a few basics.

You set up from the Precision 6000 front panel with prompting and cuing from its program. You string your set-ups together for the test routine required. One command uploads set-ups to the host computer.

Friendly is letting you all but forget programming, so you can concentrate on measurement problems.

More innovation from the leader

We're adding all the advances announced here to the features Precision has introduced over the last decade. 80 dB/octave attenuation, time delay superior to Bessel, 1° phase match, choice of serial, parallel or GPIB computer interfaces, for example. That's system friendly indeed.

SYSTEM FRIENDLY FILTERS

You asked for higher frequencies, and we now offer a 1 MHz filter. You asked for sharper cutoffs, and we now provide elliptics with 130 dB/octave attenuation for frequencies up to 204.7 kHz. You asked, and we've packed more performance with greater density. We welcome you to the friendliest array of high performance filters ever offered.

You want analog data to come clean before digital conversion.

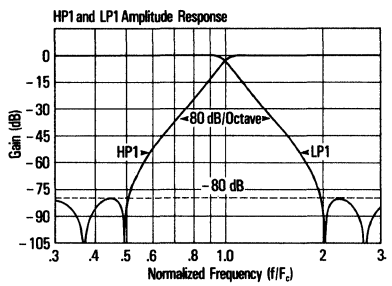
We keep extending your choice of friendly Precision HP, LP, TD, BP, BR, notch, ⅓ octave and anti-alias filters.

All are programmable. Time delay filters superior to Bessel. Elliptics now come as sharp as 130 dB/octave. Frequencies can range as high as 1 MHz. All Precision filters offer the option of fixed frequencies for economy. All have phase match of 1° or better.

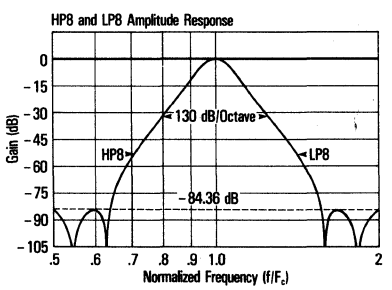
Individually, they provide different cost-performance parameters and options to provide the friendly system you need.

A filter for every need

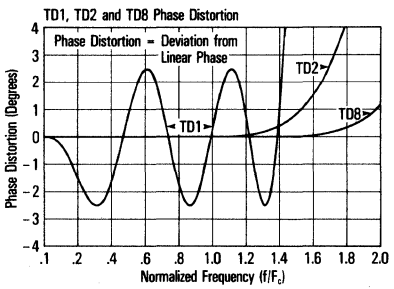
For the frequency domain, there are Cauer (elliptic) high-pass and low-pass filters. The HP1 and LP1 have 0.1 dB p-p pass-band ripple and 80 dB stop-band attenuation with 80 dB/octave attenuation

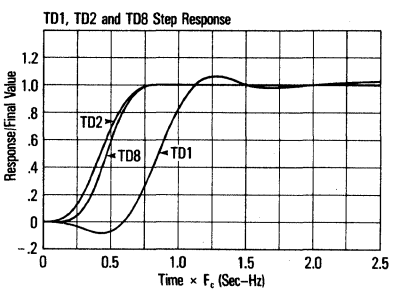


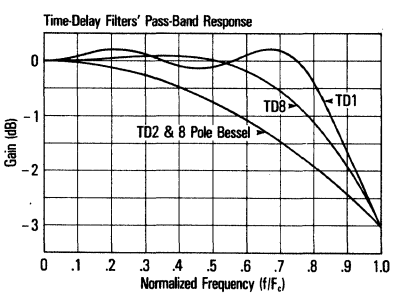
slope. The HP8 and LP8 have 0.044 dB p-p pass-band ripple and 84 dB stop-band attenuation with 130 dB/octave attenuation slope.



For the time domain, there are the TD1, TD2 and TD8 time delay filters — three friendly choices with different trade-offs of phase linearity, transient response and amplitude response. Data shown in these three graphs help select the best time delay filter for your application.

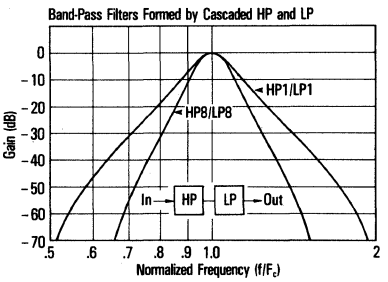




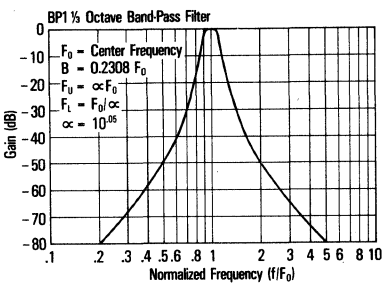


In any case, you get a tightly controlled elliptic or linear phase filter with phase match better than 1° and usually better than ½ °.

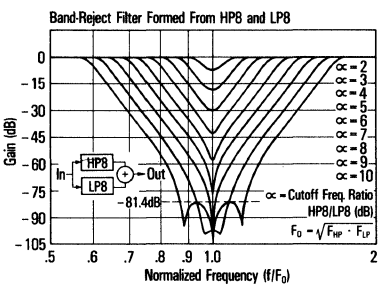
For band-pass operation, cascade a high-pass and low-pass



filter to form a band-pass filter. Or use our BP1 one-third octave band-pass filter



For band-reject operation, parallel the inputs of a high-pass and



low-pass filter and add their outputs to form a band-reject filter.

For tough anti-alias applications, use LP8 filters to provide 80 dB of attenuation at 1.56 times the cutoff frequency.

For lowest cost solutions, we provide fixed frequency filters with blank front panel and no control module.

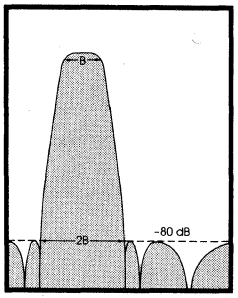
PRECISION 1776 FREQUENCY-BAND TRANSLATORS



SPECTRUM SLICER

Precision System 1776 is the industry's first multi-channel programmable frequency-band translator for signal conditioning.

It draws heavily on our advanced filter technology to provide usefulness not previously associated with frequency-band translators for applications like these:

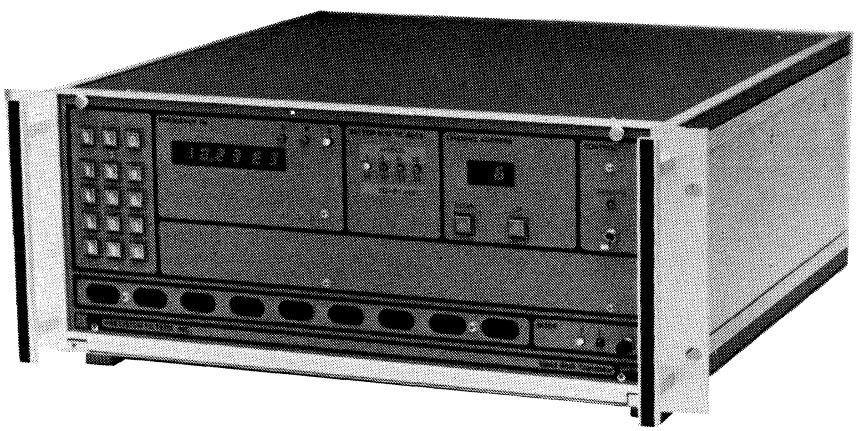
- Super bandpass filter.
- Analog zoom for spectrum analysis, modal analysis and beam forming.

The Precision 1776 cuts far more sharply than any conventional bandpass filter can.

In fact, it's nearly perfect. The system translates band center frequency to zero, passing the signal band through sharp low-pass filters to obtain 80 dB/*bandwidth-octave* skirts. Q's can go higher than 10,000.

From there, the instrument can translate back to the starting band, acting as a super bandpass filter. Or it can translate to any other part of the spectrum.

Configured as a super bandpass filter, the Precision 1776 can have up to eight channels.



SUPER ZOOMER

The Precision 1776 translator also can zoom in to make existing equipment do more work.

Ahead of an FFT spectrum analyzer, the analog zoom extends frequency range while making possible much finer resolution.

For modal analysis and beam forming, the 1776 discards unwanted noise and lowers the sampling frequency. As a result, old limits for computer speed, memory and AD conversion rates are overcome. Sampling rates can be decreased. Dynamic range and signal-to-noise ratio are enhanced.

For analog zoom, a 16 channel configuration is available for this Precision Conditioner.

Precision 1776 Features:

- Programmable center frequency 3.2 Hz—200 kHz.
- Programmable bandwidth: 1 Hz—25 kHz.
- Phase match: 2° maximum, 1° typical.
- Wide dynamic range.
- Low noise: 250 microvolts in 20 MHz BW.
- Interfaces: serial, parallel, GPIB.
- $\frac{-80 \text{ dB bandwidth}}{-3 \text{ dB bandwidth}} < 2$
- Passband ripple: 0.15 dB pk-pk.
- Outband rejection: 80 dB minimum.
- Hum: < -100 dB, re full-scale.
- Noise: < -100 dB, re full-scale.
- Intermodulation: < -80 dB, re full-scale.

This new Aerovox family of industry-standard Power Entry Module (PEM) Assemblies is manufactured to meet both Domestic and International quality standards. In their basic form, they serve as power entry devices in electronic equipment, with the added benefit of filtering emissions that are conducted through the power cord. They also offer other convenient features such as IEC Connectors, Fuse Holders, etc., in addition to optional higher levels of filtering to meet specific requirements.

Aerovox manufactures AC Filter products that reduce both Common and Differential Mode conducted emissions. In addition, we have the capability of designing, developing and manufacturing other single and three phase EMI filters for specific OEM applications or to OEM custom, predeveloped specs. Many products in this category are presently in production with UL, CSA and VDE Approvals. We also produce an extensive line of standard agency-approved filter products which are stocked by our national distributor network.

Aerovox also provides a wide array of testing and consulting services either from the factory or in the field, and can develop filters from conducted emission tests or to fit custom applications.

Aerovox presently has two manufacturing operations — one in New Bedford, Mass., to produce custom and special filters for specific applications; the other in Taiwan to produce standard and custom products in volume. All marketing and engineering functions are located in New Bedford, our corporate headquarters.

General Purpose 1, 2, 3, 4

The General Purpose 1 EMI Power Line Filters are designed for common mode applications to provide the minimum cost solution for most general purpose applications.

The General Purpose 2 EMI Power Line Filters are an alternate packaged version of the General Purpose 1 Filters utilizing an IEC power line connector to offer direct plug-in capability. As with the General Purpose 1 EMI Filters, these filters are also particularly suited for applications where pulsed, continuous and intermittent EMI interferences are present.

The General Purpose 3 EMI Power Line Filters are packaged in a configuration to include the IEC power line connector in order to offer a direct plug-in capability. They offer improved performance comparable to the Series 1 General Purpose Filters and are effective in applications where line to line and low frequency line to ground noise must be controlled and for upgrading electronic equipment to comply with FCC conductive emmissions standards.

The General Purpose 4 EMI Power Line Filters are designed to provide additional protection from line noise and protection of the line from load generated noise. They are particularly suited for applications where pulsed, continuous and/or intermittent EMI interference is present.

These filters are U.L. recognized, CSA certified, and VDE approved.

Dual Mode Suppression 1, 2, 3 & 4

Medical 1

The Dual Mode Suppression Filters utilize the same effective general purpose designs for providing control of line-to-ground noise but with additional circuitry to reduce low frequency line-to-line noise and transient. This additional circuitry in the Dual Mode Suppression Filters is a line-to-line filter with high rejection at low frequencies for limiting the line to line noise.

These filters will protect equipment from malfunctions due to conducted interference coming into the equipment from the line. These filters will also provide the needed suppression to allow most equipment to meet FCC and VDE specifications for conducted emissions. Dual Mode Suppression Filters are available in our 1, 2, 3 and 4 configuration and are particularly effective when applied in equipment utilizing switching type power supplies and SCR components.

These filters are U.L. recognized, CSA certified, and VDE approved.

Medical 1 Series Underwriters Laboratory medical and dental equipment specification U.L. 544 is applicable to this series. AeroFilter medical filters meet the U.L. specification for patient care equipment of a maximum leakage current of 100 micro amps at 120 VAC, 60 Hz.

For non-patient equipment, where the maximum leakage current of 500 micro amps at 120 VAC, 60 Hz. is allowed, the General Purpose and High Performance General Purpose Filters have special versions with low leakage requirements to meet the U.L. non-patient equipment standard. The Aerovox Medical Filter 1 has two micro amps maximum leakage current used with hospital grade/low leakage line cord (6 micro amps maximum leakage current).

These filters are U.L. recognized, CSA certified, and VDE approved.

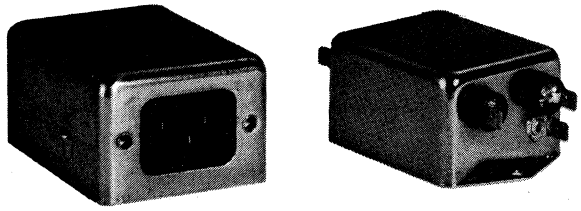
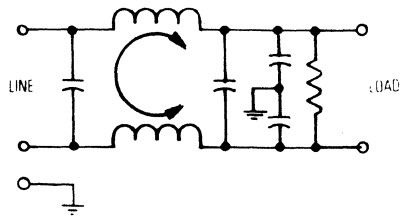
PA/PB SERIES





THE **TRI-MAG** PA/PB SERIES OF A.C. LINE FILTERS HAVE BEEN DEVELOPED PRIMARILY FOR COMPUTER SYSTEMS THAT USE SWITCHING POWER SUPPLIES. THE CURRENT RATINGS ARE HIGH ENOUGH TO ALLOW DESIGNERS TO PROTECT A COMPLETE COMPUTER SYSTEM FROM EXCEEDING THE CONDUCTED EMISSION LIMITS SPECIFIED EITHER BY FCC OR VDE.

THE PA IS AVAILABLE IN CURRENT RATINGS OF 1, 3, 5, 6 AND 10 AMPS AND THE PB IS AVAILABLE IN 1.3 AND 5 AMPS FOR OPERATION ON A.C. LINES OF 115 TO 250 VOLTS 50/60 Hz.

SPECIFY EITHER PA OR PB FOR THE CONDUCTED LIMITS THAT YOU WANT TO MEET.

ALL NEW with this edition of EEM

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $5.00 for postage and handling. An invoice will accompany your System.

Don't waste any more time. Get organized now!

Programmable Lowpass Filters

T T E's programmable lowpass filter is a 5 pole design, available in either a Butterworth or chebyshev characteristic. This is a fixed tuned unit that operates at harmonics of a specified frequency. For example if the specified cut-off frequency is 1Hz then the filter will have 7 additional cut-off frequencies located at 2Hz, 4Hz, 8Hz, 16Hz, 32Hz, 64Hz, 128Hz and 256Hz. The cut-off frequency is externally programmed. The frequency selection is achieved using binary codes external to the filter. The frequencies are selected by applying a voltage to, or grounding one or more of three specific terminals. Another version of this unit is available. It is comprised of 5 independant filters. Choosing this option the designer may select up to 5 specific cut-off frequencies, and up to 3 different design characteristics.

Hybrid Integrated Circuits for Military and Industrial Applications

Aeroflex designs, develops and manufactures custom hybrids for both military and industrial customers. We are qualified for use on B-1B, B-52, F-15, F-16, LAMPS MKIII, AMRAAM, LANTIRN plus numerous other ground and airborne systems and medical and communications equipment.

Will a custom hybrid do your job? Hybrid technology combines the quick response design and manufacturing economies of the printed circuit assembly with the reliability and small size of the monolithic IC. To help you determine when the method will be cost effective, Aeroflex's experienced engineers will consider the circuit itself, manufacturing lead time and the quantities involved.

Once the decision has been made, Aeroflex has the technical and manufacturing support to meet your most exacting requirements. Our circuit designers will meet your parameters in the smallest, lightest package consistant with effective performance.

We excell in digital designs incorporating our own VLSI logic components, active filters, low noise preamplifiers, medium power voltage regulators and amplifiers, drivers and receivers and digital interface circuits to meet MIL-STD-1553. Electrical performance is guaranteed by full testing using automatic test systems where appropriate.

Our complete manufacturing facilities have the skilled personnel and latest production equipment to meet every hybrid design and manufacturing requirement. For most designs we use thick film deposition for flexibility, augmented where required by thin film resistors and conductors. Various gold, silver and other precious metal conductors are employed as well as a variety of resistor inks to cover a very broad range of resistor values. We use lasers for active and passive trimming.

Aeroflex produces cost effective new solutions with packaging approaches in both hermetically sealed all metal cases and epoxy sealed ceramics.

Product Assurance from start to finish. Our Product Assurance organization and processes meet the requirement of MIL-Q-9858A. Quality Assurance, Quality Control, Qualification Testing and Equipment Calibration are its responsibility, starting with incoming inspection of components through screening and qualification testing in accordance with the latest standards. Often we don't just meet difficult requirements but exceed them, unit after unit, year after year.

IC MASTER BELONGS ON YOUR BOOKSHELF

If you don't have your own IC MASTER, you can obtain your own copy by ordering now. Write for your own copy or order by telephone as described below.

IC MASTER is a two-volume set of technical data carefully organized to direct the engineer to the integrated circuits and related products that are closest to his specific needs. It is the surest and fastest way to find the optimum devices to answer an engineering design requirement. By ordering now, you won't have to borrow or search for IC MASTER the next time you need it.

Typical Use of IC MASTER
Can an engineer find out who makes a 256K dynamic RAM with an access time of 120 nanoseconds or faster in less than 30 seconds? He can if he turns to the Memory section of IC MASTER and looks for the 256K organization (words and bits per word) that he needs. Because each device is listed in order of access time, he can easily determine the devices that satisfy his speed requirements.

Telephone Ringing Detector — LB1006AB

Description

The LB1006AB Telephone Ringing Detector provides ringing detection functions from the Tip-Ring pair of a telephone loop. This device provides a nominal output current (up to approximately 1 mA) for two types of output drivers. The output can be connected to either an opto-isolator device or to a logic interface with a microprocessor.

Applications

The LB1006AB Detector derives its power by rectifying the ac ringing signal from the Tip-Ring pair of a telephone loop. It operates over widely varying ringing waveforms (15 to 68 Hz at 40 to 150 Vrms). It uses this derived power to activate ringing-detector logic, and then transfers most of this power to an output current driver. There is essentially no loading under non-ringing conditions. This device has two outputs, OUT H and OUT L. The OUT H output is used to source output current when ringing is detected. The OUT L output becomes functional when the OUT H output is connected to the mirror input. The OUT L output will sink current when ringing is detected (see Simplified Output Diagram). This device does not have to depend upon power derived from the Tip-Ring inputs to become operational. Connecting an external voltage source to V+ will also allow the device to operate in what is described as "stand alone applications." Applications for the two types of outputs (source or sink current) are shown in the Application Diagrams.

Features

- Provides an inexpensive means of ringing detection
- Operates on less than 1.0 mA from the telephone loop
- Internal polarity guard and 2000 V lightning surge protection
- Immune to rotary dial pulsing (bell tap)
- Meets both Type A and B ringing requirements (40 Vrms <V_{IN} <150 Vrms, 15 Hz <fin <68 Hz) as specified by EIA RS-470 and FCC Part 68
- Ringer equivalency: 0.8 B when configured as shown in the Application Diagrams

ALA201/202 UHF Linear Arrays

Description

The ALA201/202 UHF Linear Arrays are semi-custom integrated circuits consisting of vertical NPN and PNP transistors, programmable and fixed capacitors, and implanted boron resistors. Designed on a regular grid system, the array provides easy interconnection for the designer. The ALA201/202 UHF Linear Arrays are fabricated in a complementary bipolar integrated circuit (CBIC) process that offers the advantages of similar NPN and PNP transistor characteristics at very high speeds. Typical f_T of 4.5 GHz for the NPN and 3.75 GHz for the PNP transistors (V_{CE} = 6 volts and I_C = 3 mA) with high current drive capability (8 mA for the NPN and PNP 1X transistors) is unique to these linear arrays.

Dual-layer and thick metal are typically used for most applications; however, single-layer metal may be used upon special request. The bottom and top metal layers have a low sheet resistance of about 0.03 ohm/sq. and a current capacity of 2 mA/μm of metal width. The standard 6 μm bottom and 10 μm top metal linewidths are capable of carrying a maximum of 12 and 20 mA dc current, respectively. For cases where high-current must be carried, a thicker gold layer called "thick metal" is available with a sheet resistance of about 0.004 ohms/sq. and a current capacity of 14 mA/μm of metal width. The ALA201 device is divided into 6 modules consisting of 5 standard and 1 power module. The ALA202 device is divided into 12 modules consisting of 9 standard, 2 power, and 1 input module. All modules are symmetrically located within the array for easy layout. The modules, being on a regular grid system, allow the user to interconnect components by drawing lines on a clearly defined grid marked on a layout sheet.

For more detailed information regarding ordering procedures, design kits, and packaging for the ALA201/202 UHF Linear Arrays, refer to the Semi-Custom Linear Array brochure.

ALA300/301 90 Volt Linear Arrays

Description

The ALA300 and ALA301 Linear Arrays provide design engineers the means to obtain 90 volt, semi-custom integrated circuits. The single-module array (ALA300) consists of 13 vertical NPN and 15 vertical PNP transistors, three 6 pF capacitors, and 1k diffused and 10k non-implanted resistor banks. The quad-module array (ALA301) is identical to the single-module array (ALA300), but has four times the number of components.

These linear arrays are fabricated using the complementary bipolar integrated circuit (CBIC) process that offers the advantages of vertical NPN and PNP transistors. CBIC technology offers the advantage of designing high-performance circuits with less design complexity. A minimum collector-to-emitter, reverse breakdown voltage of 90 volts is guaranteed for both transistors. Typical peak f_T of 350 MHz for NPN and 300 MHz for PNP transistors and 5 mA current drive capability for the minimum area transistors are unique for these linear arrays.

Two-level metal is used for interconnections. Upon request a thick-metal interconnect is also available to provide higher current capacity. The top and bottom metal layers have a low sheet resistance of <0.03 ohms/sq and <1.0 ohms/sq with a current capacity of 2.0 mA/micron and 60 μA/micron of metal width, respectively. The thicker metal interconnect has a sheet resistance of <0.003 ohms/sq and a current capacity of 20 mA/micron of metal width.

Features

- High-frequency performance, typical f_T of 350 MHz for NPN and 300 MHz for PNP transistors
- 90 volt capability
- Low development costs
- Quick design turnaround, typically four weeks from design approval
- Complementary vertical NPN and PNP transistors
- Two-level metal interconnect
- 1k and 10k resistor banks
- All I/O ESD protected
- Available in chip form and a variety of standard packages

ALA400/401 Linear Array Family

Description

The ALA400/401 Linear Array Family is fabricated using the complementary bipolar integrated circuit (CBIC) process that offers the advantages of vertical NPN and vertical PNP transistors. CBIC technology offers the advantage of designing high-performance circuits with less design complexity. A minimum collector-to-emitter, reverse breakdown voltage of 33 volts is guaranteed for both transistors.

Typical peak f_T of 350 MHz for NPN and 300 MHz for PNP transistors and 2 mA current drive capability for the 1 X transistors are unique for these linear arrays. Current drive capability for the other on-chip transistors is linear, e.g., 2 X = 4 mA, 3 X = 6 mA, etc. Pinch-off voltage for JFETs is 1 to 2 volts. I_{DSS} is about 1.0 mA.

The ALA400 Linear Array is divided into 16 modules, consisting of 12 standard, 2 power and 2 JFET modules. The ALA401 Linear Array is divided into 9 modules, consisting of 7 standard and 2 power modules. All modules are symmetrically located within the array for ease of design layout. Because the modules are on a regular grid system, the user interconnects components by drawing lines on a clearly defined grid, marked on a layout sheet.

Two-level metal is used for interconnections. Upon request, a thick-metal interconnect is also available to provide higher current capacity. The top metal layer has a low sheet resistance of <0.03 Ω/sq. and a current capacity of 2.0 mA/micron metal width. The bottom metal layer has a sheet resistance of <1.0 Ω/sq. and a current capacity of 200 μA/micron of metal width. The thicker metal interconnect has a sheet resistance of <0.003 Ω/sq. and a current capacity of 20 mA/micron of metal width.

Features

- High-frequency performance, typical f_T of 350 MHz for NPN and 300 MHz for PNP transistors
- 33 volt capability
- Low development costs
- Quick design turnaround, typically six to eight weeks from design approval
- Complementary vertical NPN and PNP transistors
- Two-level metal interconnect
- All I/O ESD protected

HI-REL HYBRIDS

THICK & THIN FILM HYBRID TECHNOLOGY

CTS Microelectronics produces high quality thick film hybrid circuits. The modern 101,000 square foot manufacturing facility in West Lafayette, Indiana, specializes in volume production of "Hi-Rel" and commercial grade chip and wire hybrid circuits, quality discrete hybrids and custom resistor networks.

CUSTOM DESIGN/ QUALITY ASSURANCE.

CTS Microelectronics works directly with the customer to establish and maintain testing procedures that will insure the highest standards of quality and reliability. Specification reviews are a standard practice at CTS. Representatives from the quality assurance, sales and engineering departments met with the customer to establish the requirements of each designed circuit prior to any production run, following the general requirements of MIL-STD-883 and MIL-M-38510.

All incoming materials go through quality assurance. There, samples are taken, tested and quarantined until written approval is given to release them to stock.

The in-process inspection system checks circuits at all stages of manufacturing to insure highest quality workmanship and adherence to specifications. Finally, quality assurance inspectors thoroughly test the finished circuits. Records from each stage of design and manufacturing for all circuits assure complete traceability of a project.

CTS Microelectronics' in-house testing facilities include vibration, shock, centrifuge, thermal shock, temperature cycling, moisture resistance, leak testing, PIND, burn-in, life testing and moisture/gas analysis. These are applied as an effective check-and-balance system to assure consistent quality and reliability in circuit manufacturing.

THICK FILM HYBRID ICs

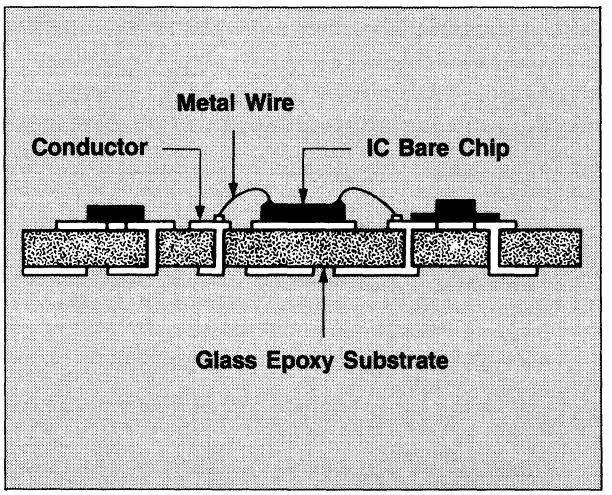
FDK's advanced technology

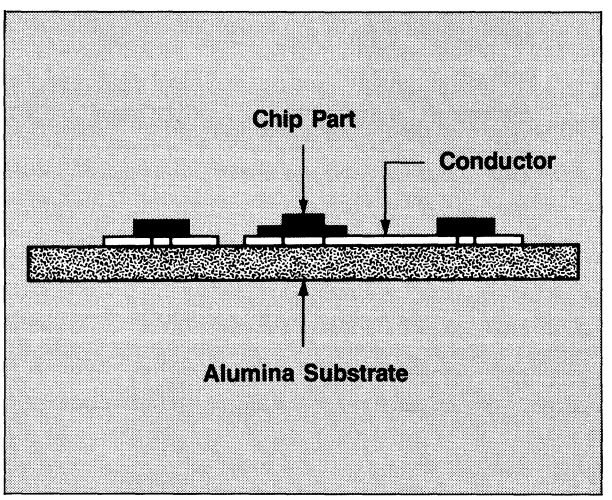


COB (Chip-On-Board) technology

COB technology that achieves greater integration than was previously possible is utilized to bond bare chips directly to a glass epoxy substrate. With this technology, it is also possible to package CPU, custom ICs and memory devices. Thus, long or large products which are impossible to produce using alumina substrates can be made—e.g., thermal heads, contact sensors and other parts used in facsimile and similar machines.

User Benefits

- Reduction of product size and weight, made possible by larger-scale integration
- Low cost
- High mechanical strength

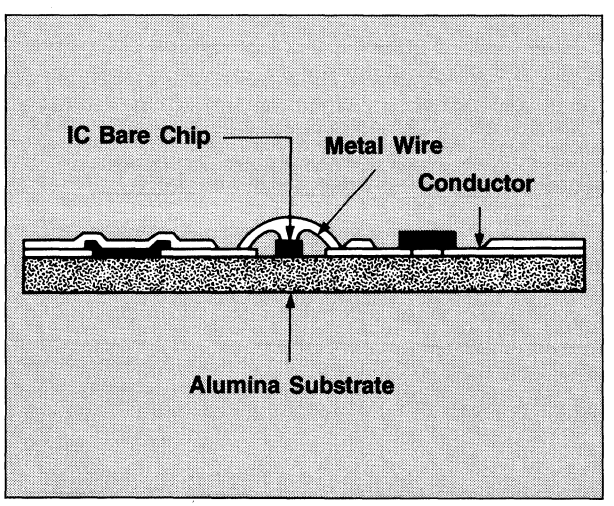


SMT (Surface Mount Technology)

With this technology, hybrid ICs are made by automatically mounting chip parts onto various types of substrates. Because parts are abundantly available and automatic mounting is possible, this technology is suited for use in mass production of hybrid ICs.

User Benefits

- Low cost
- Ease of customization
- Availability of various circuit functions



Chip & wire technology

With chip & wire technology, bare chips are mounted on various substrates, including alumina and aluminum, and packaged by wire bonding. Hybrid ICs produced by this technology, the most mature and time-tested of the three, are widely used in applications ranging from industrial products to consumer electronics.

User Benefits

- Large scale of integration
- High reliability
- Ease of customization
- Total cost reduction

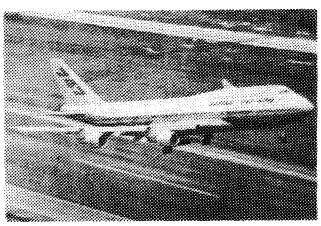
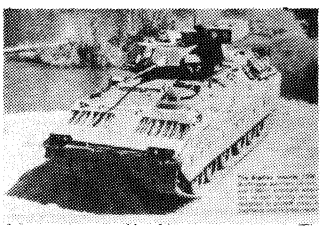
The Navy's Aegis class cruisers use ICI hybrids in radar and communication systems, as well as in the Vertical Launch System and SM-2 surface to air missiles.



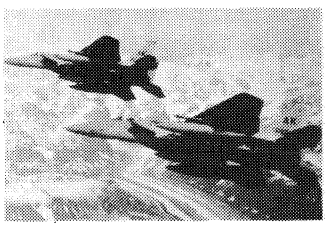
Commercial Aircraft

ICI hybrids are used in cockpit instrumentation and power control systems. Advanced avionics on the 747-400, 737-300, and MD-11 depend upon ICI hybrids.



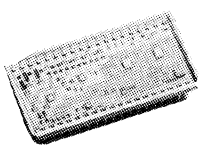
Army

ICI meets rugged military needs in the hybrids used in the TOW missile night sight on the Army's Bradley fighting vehicle. M-1 main battle tank and MLRS system rely upon ICI products.



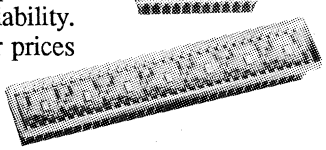
Military Aircraft

Since 1973, ICI hybrids have been part of the sophisticated avionics of the F-15 fighter aircraft. ICI hybrids are aboard the B-1, F-14, F-16, and F/A-18 aircraft.



Commercial Quality

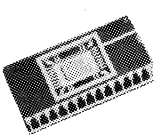
ICI builds all hybrids in the same MIL-STD-1772 qualified facility, providing commercial-grade hybrids with a high level of quality and reliability. Yet, ICI's location and volume production keep our costs and your prices low. The best for less in commercial quality.



Special Requirements

Custom Chip Packaging

If you need a special package or special testing for a single-chip circuit, ICI can meet your needs.



Magnetics

Since 1971, ICI has incorporated magnetics in hybrids. ICI is one of the few companies able to mix thick film and transformer technologies into one hybrid device such as this DC-DC converter used in guided munitions.

33 MHz TTL-Compatible FIFO
Fast Performance—20ns Access, 30 ns Cycle
Low Active Current—100mA @ 33 MHz
Fully Static CMOS Memory Array
Full Asynchronous Read & Write Operation

Description

The LH5496/97/98 are dual port memories with internal address generation to implement a First-In-First-Out algorithm. Through their advanced dual port architecture, they provide fully asynchronous read/write operation. Empty, Full, and Half-full status flags are provided to prevent data overflow and underflow. In addition, internal logic is provided for unlimited expansion in both word size and depth.

Read and write operations automatically access sequential locations in memory in such a way that data is read out in the same order that it is written in, that is, on a First-In-First-Out basis. Since the address sequence is internally predefined, no external address information is required for the operation of this device. A ninth data bit is provided for parity or control information often needed in communications applications.

Empty, Full, and Half-full status flags monitor the extent to which data has been written into the FIFO, and prevent improper operations (i.e. READ if the FIFO is empty, or WRITE if the FIFO is full). A retransmit feature resets the READ address pointer to its initial position, thereby allowing repeated readout of the same data. Expansion-in and Expansion-out pins implement an expansion scheme that allows individual FIFOs to be cascaded to arbitrary depth without incurring additional latency (bubblethrough) delays.

These FIFOs are designed for applications requiring simultaneous and asynchronous read/write capabilities. Typical uses for these devices are found in communications, multiprocessing, and rate buffering applications.

SHARP

64K × 4 CMOS Static RAM

LH52252

Description

The LH52252 is a high speed 262,144 bit static RAM organized as 64K × 4. A fast, efficient design is obtained with a CMOS periphery and a matrix constructed with polysilicon load memory cells.

This RAM is fully static in operation. The Chip Enable ($\overline{E}$) gates power to the chip when $\overline{E}$ is high. Standby power drops to its lowest level (I_{SB1}) when $\overline{E}$ is raised to within 0.2V of Vcc.

Write cycles occur when both $\overline{E}$ and Write Enable ($\overline{W}$) are low. Data is transferred from the DQ pins to the memory location specified by the 16 address lines.

Read cycles occur when $\overline{E}$ is low and $\overline{W}$ is high. A Read Cycle will begin upon an address transition, on a falling edge of $\overline{E}$, or on a rising edge of $\overline{W}$.

High frequency design techniques should be employed to obtain the best performance from this device. Solid, low impedance power and ground planes, with high frequency decoupling capacitors, are desirable. Series termination of the inputs should be considered when transmission line effects occur.

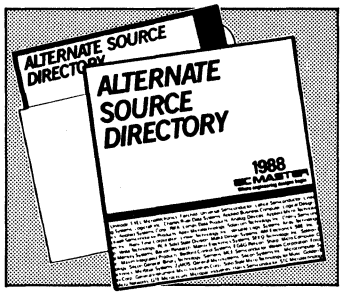
HEARST ENGINEERING SOFTWARE

ICMASD...IC Alternate Source Directory

If you've used the IC MASTER, you know what the Alternate Source Directory is. Engineers tell us that it's one of the most valuable sections of the Master. The Alternate Source Directory...ASD...is now available in floppy disk form.



The electronic ASD is FAST! Just ask a question and the answer pops up in a split second.

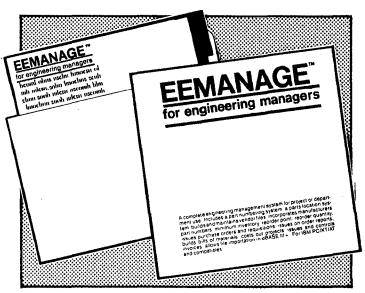
The electronic ASD is FLEXIBLE! You can add ICs and you can add comments.

You can add part numbers, prices, technical notes or anything else you like. You can customize the ASD to fit your needs and the needs of your company.

Order the 1988 Alternate Source Directory for your AT, XT or compatible. We'll send you two floppies and a very simple piece of printed documentation. Download the floppies and you're in business. All you need is a hard disk.

EEMANGE...for engineering managers

Developed by the publishers of EEM/ Electronic Engineers Master, EEMANAGE is a software program designed to make life easier for engineers and engineering managers.



EEMANAGE does many things: 1. Develops Bills of Materials 2. Assigns Part Numbers logically 3. Manages Engineering Inventories 4. Issues Purchase Requisitions 5. Relieves Engineering Inventories 6. Manages a Parts Storage System 7. Issues Engineering Change Notices 8. Interfaces with dBaseIII+ Programs.

EEMANAGE is completely menu driven. It is simple to understand and operate. Any competent secretary can be up and running on EEMANAGE in minutes.

Order EEMANAGE for your AT, XT or compatible. We'll send you one floppy and brief, very user friendly documentation.

The basic price for ICMASD or EEMANAGE is $149.50 each and includes floppy disk(s) and complete program documentation.

For immediate shipment you can order ICMASD or EEMANAGE on your VISA or MasterCard credit card simply by calling Marie Botta at (516) 227-1300.

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $5.00 for postage and handling. An invoice will accompany your System.

Don't waste any more time. Get organized now!

- Crosstalk always lower than isolation
- Switchpoints individually field replaceable
- Extremely low EMI
- Low VSWR
- Matrix configuration easily assembled using 9000 series cross straps
- Signal circuits isolated from control circuitry

MATRIX 7000 Series Relay Modules are designed to maintain coaxial switching continuity over a wider range of critical and high environmental applications. The Relay housings are constructed of precision machined aluminum alloy for structural integrity and hard anodized for durability. All signal shield paths are silver plated with covers gasketed for maximum EMI protection. The basic reed switch elements are hermetically sealed in nitrogen filled gas envelopes and employ rhodium plated contacts to insure non-stick operation. Applications for MATRIX 7000 Series include:

— R.F. and I.F switching where a low VSWR is required.
— CCTV, base band video and pulse switching where low phase distortion and high pulse fidelity are required.
— Applications requiring a high degree of shielding integrity and low contact and induced noise such as pre amp input switching or the switching of high impedance operational amplifier inputs.

Matrix and hybrid switching systems are easily constructed by using Series 9000 (no output), 9100 (one output) or 9200 (two output) push-on cross straps which mate with the BNC connectors on the switch modules. The cross strap output connectors are BNC female type UG 1094/U. The model number of the cross strap is assigned by replacing the two zeros of the series number with the number of inputs desired. For example, a Model 9108 has eight inputs and one output.

warranty

Scientific Components Corporation, Mini-Circuits division, warrants each product manufactured by Mini-Circuits to meet all published specifications and to be free from defects in material and workmanship. The Company's liability under this warranty is limited to repair, adjustment and/or replacement of defective parts returned, freight paid by Buyer, to the factory within a period of one year from date of shipment from the factory unless a shorter period is specified. International customers may ship to the Company's nearest Distributor.

A fee will be charged to the Buyer to cover the costs of inspection and test of units returned under this warranty and subsequently found to meet specifications or to be faulty for reasons which are not Mini-Circuits' responsibility. This warranty excludes all other warranties expressed or implied. Mini-Circuits shall not be liable for any special, indirect or consequential damages.

Mini-Circuits

how to use this guide

Over 1,000 RF/microwave signal-processing components are available to the design engineer from Mini-Circuits. This guide has been organized to simplify the process of selecting the component best suited to your application. SECTION 1 GIVES A LISTING OF ALL THE PRODUCT FAMILY GROUPS—from frequency mixers to power splitters to RF transformers—plus warranty and ordering details.

LOOKING FOR DATA ON A SPECIFIC MODEL? The model index contains a list of all models in alphabetical/numerical order with reference to specification and data pages.

FOR A CONCISE PRODUCTION/TEST FLOW DIAGRAM see section 1, illustrating Mini-Circuits quality-control procedures; and detailed information on our Hi-Rel, MIL, and TX products for your military, space or rugged industrial applications.

SPECIFICATION PAGES. Each specification page is organized by series within the product line and by models within the series. Information given includes National Stock Numbers (NSN), equivalent MIL—part numbers, pin connection designations, case styles, and notes to the tables.

Full specifications for each model are given in table form. The various models within a series differentiate from each other by the frequency range they cover.

Mixer selection is primarily determined by the mixer level suitable for the application. Therefore, frequency mixers are organized in sequence of mixer level—Level 7, 10, 13, 17, 17S, 23, 23S and 27. A Level 7 mixer operates with +7 dBm LO drive, a Level 13 mixer operates with +13 dBm LO drive, etc. For each level mixer, a maximum RF input level for linear operation is specified.

CASE STYLES AND DIMENSIONS ARE EASY TO FIND . . . Each series has a particular case style. The specification page includes a photo and a reference number to the particular dimensions and outline drawing of the case. Turn to section 1, for case style dimensions, tolerances, bracket options, case material and finishes.

Someone has to be best.

It's always been that way.
In politics, in sports, in business. Someone who's more aggressive, more courageous, more dedicated.

Take Mini-Circuits, for example, supplying RF signal-processing components worldwide.

While other companies boasted about their product reliability, we worked at it ... pioneering HTRB (high-temperature, reverse-bias) testing to screen potentially faulty mixer diodes; performing burn-in, thermal shock, and fine and gross leak testing on standard off-the-shelf units; innovating powerful in-house quality-control techniques such as mandatory requirements of unit-to-unit electrical performance repeatability. And we were the first (and still only) manufacturer of double-balanced mixers with a 3-year guarantee.

While others limited their standard catalog product line, we steadily added so today we offer the world's widest variety of off-the-shelf, immediate delivery products designed to perform to ***your*** specs. And this put an end to expensive, "custom" parts with their lengthy delivery delays.

While other RF signal-processing manufacturers were satisfied to offer limited data, Mini-Circuits invested six engineering man years in order to provide customers with exclusive Computer-Automated Performance Data (CAPD) ... the most detailed information ever published for standard catalog items.

While other firms were increasing prices and debating the wisdom of applying computer-aided systems for parts procurement, delivery scheduling, and automating manufacturing and test, we were busy putting such systems into operation. As a consequence, more than 95% of our product line has not been given a price increase during the past ten years. We can't guarantee how long this price freeze will continue, but we pledge our commitment to further maximize all of our products price/performance goals.

Quality, performance, delivery, and low cost. Mini-Circuits ... dedicated to finding new ways and setting higher standards.

The Most Reliable Mixers Anywhere.

Ultra-Rel™ Mixers with a 5 year Guarantee At No Extra Cost.

Our secret to this reliability breakthrough is an Ultra-Rel diode capable of withstanding considerably more punishment than specified by MIL-STD-883; the result of an intensive two-year, one million dollar joint development program by Hewlett-Packard and Mini-Circuits. And since mixer reliability is primarily determined by the reliability of the diodes in the assembly, the more reliable the diodes, the more reliable the mixer. That's the key:

Based on a major technological advance in the processing of monolithic devices, these new Ultra-Rel diodes achieve an order of magnitude improvement in reliability over currently-available Schottky diodes.

To put it bluntly, these new Ultra-Rel diodes can meet and exceed MIL-STD-883 tests with ease. MIL-STD-883 calls for diodes to be temperature stressed for 25 cycles -65° C to +125° C; Ultra-Rel diodes have no trouble with 200 cycles from -65° C to +175° C. And the Ultra-Rel devices can withstand up to ten times the mechanical pull test requirement of MIL-STD-883.

Only Mini-Circuits' Ultra-Rel mixers include Ultra-Rel diodes, no one else has them. And no one else offers a five-year guarantee. Look for the Ultra-Rel Stamp on your mixer... don't settle for anything less.

True... few of your applications will dictate such demanding levels of endurance. But consider the enhanced reliability and significantly extended MTBF gained by specifying Mini-Circuits' Ultra-Rel mixers in your systems design. In today's tough competitive environment, your trouble-free systems are your best salesmen.

So, think long-life performance... specify Ultra-Rel mixers. To select the specific mixer to meet your electrical performance requirements, see the detailed specs in Vol. 1 or 2 of our RF/IF Signal Processing Handbooks.

Mini-Circuits

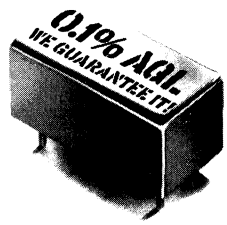
AQL (acceptable quality level)



Subsystem and systems manufacturers improve production yield by screening out defective components before they can be fed into the production cycle. A brute-force approach, often taken, involves 100% testing of each component at incoming inspection; it's a costly, time-consuming process.

Another method is to work with a modern statistical sampling acceptance plan, based on clearly-defined probability principles, which have been converted into formulas and charts or tables. An acceptable sampling table may be defined as a specific set of procedures in which lot size, sample size and acceptance criteria are related. One quality index used with statistical sampling tables is Acceptable Quality Level (AQL) which may be defined as the maximum percentage of units that do not meet requirements in a lot which, for the purpose of acceptance sampling, can be considered satisfactory as a process average. For example, using an AQL level of 1% for a lot size of 125 units; 4 or more rejects out of the 125 sample size is cause to reject the entire lot. Tables using AQL as its index offer high assurance of the acceptance of a lot when process quality is equal to or better than the specified AQL.

Mini-Circuits, the world's largest manufacturer of RF signal-processing components, has extensive experience with incoming components and is concerned with the mounting costs of incoming inspection and, even worse, the staggering cost of locating a defective part after it has been assembled into a subsystem or system. As a rule of thumb, if it costs 50 cents to find a component at the incoming inspection stage, it will cost five dollars to locate and replace it at the subassembly stage. Should the defective component somehow not be caught during subassembly test, it may be found (hopefully) during final system checkout at the factory with troubleshooting costs close to $50.00. However, should the system be shipped and show up as inoperative at the customer's site, the cost to the manufacturer could reach $500.00.

That's why Mini-Circuits doesn't go along with 1% AQL, commonly offered by parts manufacturers. Our customers deserve better. So we guarantee 0.1% AQL. Simply stated, it means no rejects are allowed in every shipment of 1,000 units. We're convinced our automated manufacturing systems, quality control procedures, and computer-automated testing are fully capable of meeting such a challenge.

reliability and quality control

All Mini-Circuits' RF signal-processing components are subjected to rigid quality control procedures starting from raw material procurement through product production and final inspection; the objective—to supply our customers with the finest RF signal-processing components available. Here's a list of some of the procedures taken to insure high-quality performance and product reliability.

A. 100% testing of each unit in process.
B. 100% testing of each completed unit.
C. 100% inspection of every solder connection.
D. All transformers bonded to the header for protection against severe shock and vibration.
E. All resistors and capacitors bonded to the header for severe shock and vibration protection.
F. Resistor power dissipation derated more than 50%.
G. All components rated for greater than +125°C.
H. All transformer leads double wrapped.
I. Heavy coated wire insulation for HiPot/altitude.
J. Completely encapsulated for protection against mechanical shock/vibration and temperature shock.
K. Permanent case marking of model number.
L. Cupro-Nickel case for long-lasting finish especially under salt atmosphere conditions.

hi-rel power splitter/combiners

To assure high quality and long-term reliability, Mini-Circuits' Hi-Rel power splitter/combiners are subjected to:

1) bake-in for 96 hours at 100°C
2) thermal shock per MIL-STD-202, Method 107
3) gross and fine leak tests, per MIL-STD-202, Test Method 112B, Condition A and C

4) burn-in; units will be operated at rated RF power and temperature in accordance with customer requirements. Please consult factory.

mil-components

Mini Circuits screens MIL-power splitter/combiners to MIL-P-23971 Group A and Group B electrical tests; in Group A, 100% of the lot quantity is tested. In Group B, tests are performed on units selected from Group A according to the sampling plan of MIL-STD 105 special inspection level S-3.

After each unit undergoes an environmental MIL-stress the units are electrically tested to ensure compliance with the applicable MIL specification and customer drawing. These tests generally include insertion loss, isolation, amplitude balance, VSWR, and phase balance.

MCL MIL components which undergo Group A and Group B of MIL-P-23971 are marked with the Mini-Circuits model number followed by /MIL.

When the military part number marking is required, the units must be on the QPL list or must be manufactured from a lot for which first article inspection has been performed. In this case, please contact the factory for pricing and contract requirement review.

Above models are resistive power dividers to enable frequency coverage from dc to the highest rated frequency. Since resistive power dividers do not provide a high degree of isolation (basically isolation equals the insertion loss between ports), an amplifier such as Mini-Circuits' ZFL series is recommended when high isolation is required. Matched power rating 0.75W, internal load dissipation 0.375W.

NOTES:

• +15dBm below 1000 Mhz.
■ ZFL-1000 output VSWR 2.8:1 maximum over 750-1000 MHz; 1 dB compression + 7 dBm 500-1000 MHz
▲ VSWR 1.6 maximum from 0.1 to 0.2 MHz.
1. Operating temperature is −55°C to +71°C except the ZFL-2000 is −55°C to +100°C. When models ZFL-1000H and ZFL-2000 are mounted to chassis using a thermoconductive paste, their operating temperature range will be increased.
2. With no load output, derate maximum input power (no damage) by 10 dB.
3. Prices and specifications subject to change without notice.
* Above 500 MHz, 24 dBm

For PC applications, select from the low-cost, plastic-case T series (small enough to be inserted into a standard 1/3 DIP socket), or the hermetically-sealed RFI shielded TMO metal-case series (requiring less PC area than a flatpack or TO-5 can), or the plastic-case T-H series designed to handle up to 100 mA in the primary winding without appreciable saturation or change in RF characteristics.

Transformer core saturation is influenced by (1) dc current through the winding, (2) RF input power, and (3) frequency of operation. These three variables interact to affect the point at which saturation occurs, see Figs. (1) and (2). These curves show the point where distortion occurs, by visual observation.

Now comparing the T-H series to the conventional T-series in Figs. (1) and (2), note that saturation effects are negligible with the T16-1H; so for wide dynamic range applications, specify the T-H series.

These transformers may be operated as low as 12.5 ohms at the primary with essentially the same impedance matching ratio and only a slight change in frequency response.

For each RF transformer model, the minimum and maximum frequency is given for the insertion loss at the 3 dB, 2 dB and 1 dB points, as shown in Fig. (3) and listed in the data chart. For example, the T1-1 insertion loss is 1 dB from 2 to 50 MHz and 3 dB from 0.15 to 400 MHz.

Coaxial connector models are available from 10 KHz to 500 MHz and are offered with 50 ohm and 75 ohm impedances; 75 ohm connectors are used at 75 ohm ports. The FT 1.5-1, with unbalanced input and output, is especially useful for 50 ohm to 75 ohm matching applications. The FTB series with unbalanced output and balanced input (connector ground insulated from the case) helps eliminate ground loop problems, especially when long cable runs are involved.

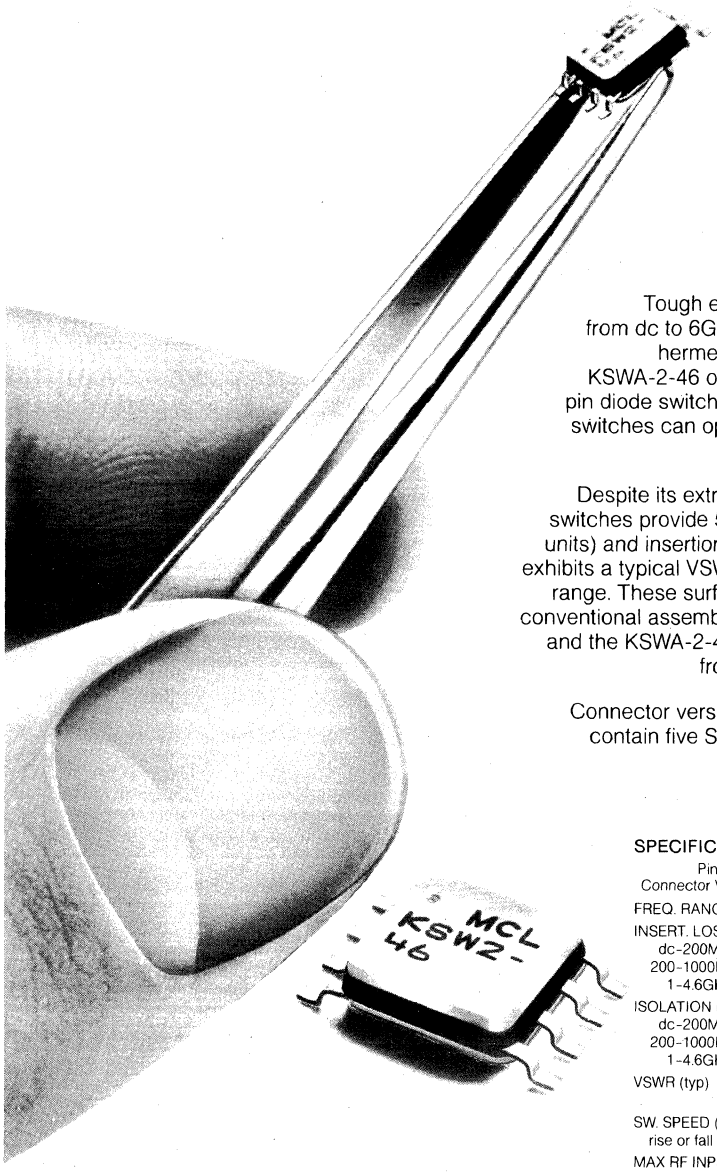
tiny SPDT switches

absorptive... reflective



dc to 4.6GHz from $32.95 (1-24)

Tough enough to pass stringent MIL-STD-883 tests, useable from dc to 6GHz and smaller than most RF switches, Mini-Circuits' hermetically-sealed (reflective) KSW-2-46 and (absorptive) KSWA-2-46 offer a new, unexplored horizon of applications. Unlike pin diode switches that become ineffective below 1MHz, these GaAs switches can operate down to dc with control voltage as low as -5V, at a blinding 2ns switching speed.

Despite its extremely tiny size, only 0.185 by 0.185 by 0.06 in., these switches provide 50dB isolation (considerably higher than many larger units) and insertion loss of only 1dB. The absorptive model KSWA-2-46 exhibits a typical VSWR of 1.5 in its "OFF" state over the entire frequency range. These surface-mount units can be soldered to pc boards using conventional assembly techniques. The KSW-2-46, priced at only $32.95, and the KSWA-2-46, at $48.95, are the latest examples of components from Mini-Circuits with unbeatable price/performance.

Connector versions, packaged in a 1.25 x 1.25 x 0.75 in. metal case, contain five SMA connectors, including one at each control port to maintain 3ns switching speed.

description

These new high efficiency phase detectors are the only units in the world offering a figure-of-merit greater than 125 from only $15.95.

The figure-of-merit M or efficiency of a phase detector can be defined as the ratio of maximum DC output voltage (in mV) divided by the RF power (in dBm). The maximum DC output from these units is 1000 mV with +7 dBm applied to the LO and RF ports, and DC offset is typically 400 microvolts. Thus, its figure-of-merit M is 143, which indicates a highly efficient phase detector. For comparison, a double-balanced mixer used as a phase detector offers 350 mV DC output with the same LO and RF inputs for a figure-of-merit M of 50.

Both the RPD and MPD are packaged in a hermetically-sealed EMI-shielded metal case. The miniature RPD measures 0.4 x 0.8 x 0.4 in. and the micromin MPD only 0.2 x 0.5 x 0.25 in.

So when your system requires a high output phase detector, specify the new RPD or MPD series.

We Guarantee Quality

Many manufacturers talk about quality rarely defining specific terms or numbers.

Mini-Circuits guarantees quality . . . clearly defined. Some manufacturers are content, and even boast, of their 1.0% Acceptable Quality Level (AQL). But a 1.0% AQL means it is o.k. to pass a 1,000 lot size even if 3 rejects are found in a sample lot of 125 units. Mini-Circuits considers 1.0% AQL dangerously inadequate for today's systems designers. Just one defective mixer or coupler appearing at the final test of a system can cause extensive delays and excess costs.

So we at Mini-Circuits guarantee our customers 0.1% AQL; no rejects ... not even one ... on every order shipped. If you encounter one failure, repack the entire lot and ship it back to us, collect. We will 100% retest every unit and return the entire order promply, postage prepaid.

It could cost us a lot of money. But we are not worried. We ship millions of RF signal-processing components, for thousands of military programs in the U.S. and over 20 foreign countries, to tight quality-control specs.

We have utmost confidence in our automated assembly system, our practice of 100% screening each diode, microscopic inspection of all solder connections, screening (burn-in, thermal shock, and gross/fine leak tests), complete encapsulation for shock and vibration, and thorough testing of each completed unit.

We encourage you to add a 0.1% AQL on all of your specs, drawings and purchase orders. You are entitled to such quality. Mini-Circuits will meet the 0.1% AQL spec now. And we will continue our quest to even further improve quality.

μicrOpuck® Circulators & Isolators

The Micropuck® family of circulators and isolators was designed to maximize the use of isolators and circulators in stripline and microstrip applications. They are easy-to-mount devices with magnetic shielding which prevents detuning or changes in performance when operating in magnetic fields or in close proximity to ferrous metals. The round design and tab lead configuration allow installation at a reduced cost, replacing milling operations with a simple drilled hole.

The Micropuck® isolator is also available in a flange mount similar to the mounting used on some power transistors. This construction has input and output tabs located 180° from each other as opposed to the 120° separation of the round version. This provides an alternative choice for system designers who prefer the screw-down mounting and can allow the extra space it requires.

Specifications for these microminiature ferrite devices are as good as you'll find anywhere. Look at the data and call our ferrite sales group or local representative.

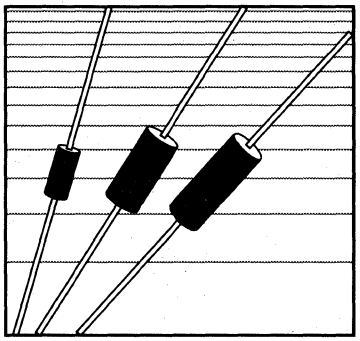
ANGSTROHM

PRECISION METAL FILM RESISTORS

■ Established Reliability ■ Hermetically-sealed
■ MIL-R-55182, Style RNR/RNN ■ Characteristics C and E



For the ultimate in reliability, stability and uniformity of construction, ANGSTROHM hermetically-sealed metal film resistors are unquestionably first-choice. ANGSTROHM has accumulated over 1.234 billion unit failure rate hours to MIL-R-55182 on the RNR/RNN style, characteristics C and E, without a single failure. The true glass-to-metal hermetically-sealed enclosure seals the resistor element in an inert gas atmosphere and protects it from virtually all adverse environmental influences. The glass enclosure will withstand in excess of 3000 p.s.i. external pressure without leakage. The reliability and stability of ANGSTROHM hermetically-sealed resistors have been established by their use in nearly every military, missile, aerospace, and oceanography program having the most demanding applications and the most hostile environments.

POWER RATING

Resistors shall have a power rating based on continuous full load operation at 125°C. For temperatures above 125°C, the load shall be derated per the Power Derating Curve for all styles. For power rating at temperatures below 125°C (down to 70°C) the load may be increased per the Power Derating Curve for the particular style selected. In no case should the voltage exceed the maximum voltage rating per the Style and Electrical Specifications table for types HN, HS and HT, in the ANGSTROHM Precision Metal Film Resistors Catalog.

Features and Benefits

Uniform Quality — Consistent performance for over 50 years! Same quality built into all parts – regardless of value, rating or tolerance. MIL-SPEC and Industrial grade parts are made using the same process.

Reliable — Recognized as the **most** reliable of all electronic components, Allen-Bradley Hot-Molded Carbon Composition resistors provide freedom from catastrophic failure when used within ratings.

Predictable performance — Because of their outstanding uniformity, Allen-Bradley Hot-Molded Carbon Composition resistors exhibit consistent responses to environment and loading.

Conservative ratings — All performance specifications are based on extensive testing and massive field experience.

Rugged construction — The solid, integral structure, combining leads, insulation, and resistance material in the exclusive Allen-Bradley hot-molding process provides exceptional strength and resistance to damage in automatic handling machinery.

Wide range of values — Available in standard EIA resistance values from 1 ohm to 100 megohms. Special values available on request.

High resistance values — Resistance values from 100 megohms to 1 million megohms (1 teraohm) are available on special order in Types BB, CB, and EB.

Solderable/weldable leads — Hot solder coated leads remain easy to solder even after long periods in stock. The oxygen-free copper leads are readily weldable and allow considerable weld-schedule latitude. Stocking of resistors with two different lead materials is unnecessary.

Tracking — Allen-Bradley resistors exhibit extremely uniform tracking characteristics. For example, in flip-flop circuits, resistors used in pairs which are drawn from the same package or reel (a normal mass production practice) will track with each other throughout changes of temperature, humidity, and load. This assures reliable circuit performance throughout the design life of the equipment.

Durable color coding — Baked-on color code paints are resistant to solvents, and also resist the abrasion and chipping associated with automatic handling. They remain bright and easily readable even after long periods of use.

Temperature stable — Between 0° C and 85° C, Allen-Bradley Hot-Molded Carbon Composition resistors exhibit a very low temperature characteristic, typically less than two percent deviation from room temperature values, less in low resistance values.

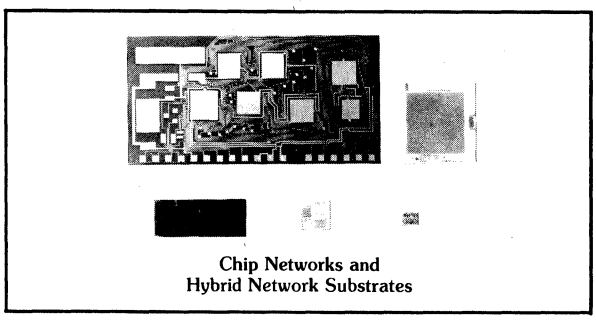
Chip and Hybrid Network Substrate



Chip Networks and Hybrid Network Substrates

Hybrid network substrates — Allen-Bradley hybrid network substrates contain resistors, bonding pads and interconnections used in producing hybrid networks. Allen-Bradley does not manufacture complete hybrid circuits, but does manufacture the basic hybrid network substrates.

Termination and bonding pad material — Gold, with a minimum thickness of 5000A, is used for all termination pads, bonding pads and interconnections. This material is compatible with ultrasonic and thermocompression bonding methods for attaching gold or aluminum wire, integrated circuit dice, LID's or beam leaded IC's. Chip capacitors can be attached by reflow solder methods.

Substrate material — Glass: Corning 7059 glass (Barium Alumino Silicate - electrically inert [Alkali-free]) .032 ±.005 inch (0,81 ±0,13mm) thick. Ceramic: 99.5% Alumina, .010 ±.001 inch (2,54 ±0,3mm) thick.

User trimmable option — Chip and hybrid network resistors can be trimmed to tolerance by Allen-Bradley or, if needed, resistors can be designed for active trimming by the user during final hybrid assembly operations to meet predetermined functional requirements.

Applications

These precision networks are ideally suited for use on any electronic equipment requiring close tolerances and/or low temperature coefficient resistors. Some of these applications are listed below.

SEMI-PRECISION METAL FILM RESISTORS

MIL-R-39017 TYPE HN

RLR05C, RLR07C, RLR20C — Failure Rate Level S
RLR32C — Failure Rate Level M (Upon completion of 10,000 Hrs. test on May 31, 1988, S Level will be established for RLR32C).

MIL-R-39017 is the established reliability specification for semi-precision metal film resistors.

Extended life tests of over one-half billion unit test hours have proven the reliability inherent in Bradford's manufacturing process. This has been confirmed by field performance in high reliability programs such as: Minuteman, Safeguard, Mercury, Gemini, Apollo, Mariner, Poseidon, Space Shuttle, Trident and GPS, as well as our involvement in virtually every other military program requiring resistors.

PULSE WITHSTANDING PROTECTIVE RESISTORS

FP SERIES

1. Bradford has developed a new class of resistors which provides lightning withstand characteristics along with resistor functionality. The resistors, derived from the flameproof, tin oxide power film designs, are provided with a thicker film system, which enhances the lightning pulse and power surge absorption capabilities. Higher turns ratio and glass substrate provide a sharper fusing characteristic than the standard flameproof product line.
2. These resistors provide protection against a variety of electrical hazards which can change or destroy sensitive electronic equipment. In particular, high energy voltage surges caused by power line anomalies (direct power crosses or inductively coupled effects) or other momentary over-voltages.

RESISTANCE VALUES

Pulse withstanding capabilities are value dependent. Contact factory for surge test requirements.

CADDOCK
HIGH PERFORMANCE FILM RESISTORS

High Performance Film Resistors

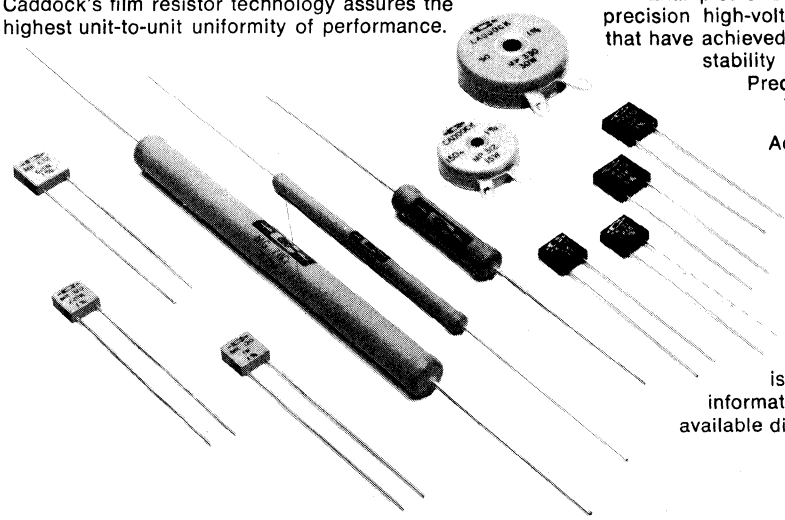
This 21st Edition of the Caddock Electronics General Catalog describes over 150 in-production models of precision discrete resistors and resistors networks that utilize Caddock's high-stability, extended-life Micronox® and Tetrinox® resistance films. With 25 years of experience and an exceptional record of in-circuit performance and reliability, Caddock Electronics continues to lead the industry in the development, production and on-time delivery of high performance film resistors.

Caddock's Advanced Resistor Technology Provides Many Exceptional Performance Advantages:

Caddock's advanced resistor technology began in 1962 with the introduction of Micronox® harsh-environment high-power and high-voltage resistors. The Caddock technology was further extended in 1975 with the development of the Tetrinox® resistance system that made possible the introduction of low TC, ultra-stable resistors and resistor networks.

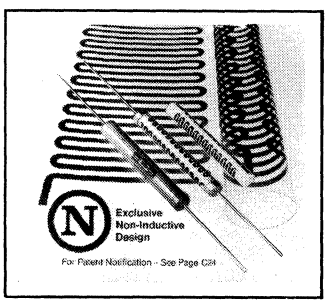
These technological advances have provided the electronics industry with a selection of precision resistor types that achieve many high-performance advantages:

- **Precision** — Tolerances as close as 0.01%.
- **Long-Term Stability** — Better than 0.005% per 1000 hours of operation under full load operating conditions.
- **Higher Power Ratings** — Up to five times higher than other resistor technologies.
- **High Operating Temperatures** — Up to +275°C.
- **Ultra-Low Temperature Coefficients** — Standard to less than 10 PPM/°C and custom values as low as 2 PPM/°C.
- **Unit-to-Unit Uniformity** — The inherent consistency of Caddock's film resistor technology assures the highest unit-to-unit uniformity of performance.



Caddock's Exclusive Non-Inductive Performance Is Available in Both High-Power and High-Voltage Micronox® Film Resistors.

For wide-band, high frequency applications, the advantages of Caddock's Exclusive Non-Inductive Design are available in most models of Micronox® resistors. This special serpentine pattern provides for neighboring lines to carry currents in opposite directions, thereby achieving maximum cancellation of flux fields over the entire length of the resistor.



The result is a truly non-inductive resistor that is about as inductive as a straight piece of wire the length of the resistor body. This efficient design means faster settling times and minimum distortion in all types of high frequency circuits.

The High-Performance Capabilities of Caddock Film Resistors Can Provide Improved Accuracy and Stability to Precision Circuitry:

Because of the special advantages of Caddock's resistance film technology, Caddock High Performance Film Resistors are often specified in the precision circuits that ultimately establish the overall accuracy and stability of the equipment.

Examples of such applications include many types of precision high-voltage supplies and voltage references that have achieved improved accuracy and extended-life stability through the use of Caddock Type MG Precision High-Voltage Resistors and Type T912 Precision Resistor Networks.

Additional examples of the application of this advanced resistor technology include the industry-wide use of Caddock Type 1776 and Type 1787 Precision Decade Divider Resistors in the signal input circuits of laboratory and bench-type digital voltage and current measuring instruments.

An introduction and index to these Caddock resistor technologies is provided on the next page. Additional information and technical assistance is also available directly from our technical staff.

We welcome your call.

CADDOCK
HIGH PERFORMANCE FILM RESISTORS

Type MG Precision High-Voltage Resistors

Now with Extended Resistance Range to 10,000 Megohms and Additional Models.

Temperature Coefficient as tight as 80ppm/°C. Combined with Excellent Long-Term Stability, and Precision Tolerances.

Caddock's Micronox® resistance films are the source of the Type MG Precision High Voltage Resistors' outstanding combination of performance features:

- Single-resistor values as high as 10,000 Megohms.
- Maximum continuous operating voltages as high as 48,000 volts ("-15" Ratings).
- Overvoltage capabilities of 150% of standard working voltages for all models and values.
- Resistance Tolerances from ±1.0% to ±0.1%.
- Temperature Coefficient, for standard resistance range, of 80 ppm/°C in combination with resistance tolerances as tight as ±0.1%.
- Typical extended life stability of 0.02% per 1000 hours for standard resistance range as demonstrated by reliability testing.

This exceptional performance has been proven through many years of use in equipment that demands the highest reliability and stability, including TWT amplifiers, X-ray systems, geophysical instruments and medical electronics.

Preconditioning For Power And Voltage Ratings

All power ratings and maximum operating voltage ratings are for continuous duty. These ratings are based on pre-stress voltage levels applied during the manufacturing process to provide for stable resistor performance even under momentary overload conditions.

Maximum operating voltages 60% higher than the values listed in the table may be specified by adding "-15" to the model number (Example: MG750-15), provided power ratings are not excceeded. Note that overload and overvoltage ratings do not apply to the "-15" resistors.

Non-Inductive Performance

Most models are manufactured with Caddock's patented Exclusive Non-Inductive design which uses a serpentine resistive pattern that provides for neighboring lines to carry currents in opposite directions, thereby achieving maximum cancellation of flux fields over the entire length of the resistor. This efficient non-inductive construction is accomplished without derating of any performance advantages.

Extended Maximum Continuous Operating Voltage Rating

Maximum continuous operating voltages up to 60% higher than the values listed in the table can be achieved through special factory conditioning, provided the power ratings are not exceeded. To specify maximum continuous operating voltages above the values listed in the table, add a "-15" to the model number. (Example, TG950-15) Note that the standard overload and overvoltage ratings do not apply to the "-15" resistors.

Combine Type TG and Type TK Resistors for Low Ratio TC Tracking Performance.

The Type TG Low TC Precision High Voltage Resistors can be used in combination with the low TC of the Type TK Low TC Precision Radial-Lead Resistors to achieve 30 PPM/°C Ratio TC without special matching.

With special matching, a Ratio TC of 10 PPM/°C can be achieved.

The low temperature coefficient for both the Type TG and Type TK resistors will also minimize ratio drift due to power dissipation warm-up.

Type THV Precision High Voltage Divider Networks

CADDOCK
HIGH PERFORMANCE FILM RESISTORS

Ratio TC to 10 PPM/°C, Ratio Tolerance to ±0.25%, Operating Voltage of 10 KVDC

The Type THV Precision High Voltage Divider Networks introduce Caddock's advanced high voltage resistor technology which doubles the allowable working voltage over the length of the high voltage section. This technology combines Caddock's Tetrinox® resistance films with laser-generated V-Notch Geometry (patents pending) which optimizes the voltage gradient over the length of the resistance pattern.

The Type THV networks provide tighter ratio temperature coefficients and tighter ratio tolerances than have previously been available in standard high voltage divider products, and include these special features:

- Ratio Temperature Coefficients of 10 PPM/°C or 25 PPM/°C.
- Ratio Tolerances of ±0.25%, ±0.5%, ±1.0% or ±2.0% at 10 KVDC.
- High Continuous Operating Voltage of 10 KVDC at +125°C.
- Standard Voltage Division Ratios of 1,000:1 or 100:1, with custom ratios available.
- Standard Input Resistance of 100 Megohms with custom resistances available.

These specifications can provide important improvements in performance in many types of advanced electronic systems, including TWT power supplies, radar systems, X-ray systems, analytical equipment and high resolution CRT displays.

HIGH PERFORMANCE FILM RESISTORS

Type MR & MS Power Film Resistors

Power Film Resistor Family with Wide Resistance Range and +275° C Maximum Temperature

With power ratings to 15 watts and voltage ratings as high as 6000 volts in an axial-lead resistor with values to 30 Megohms, the Type MS Power Film Resistors deliver the performance capabilities that can simplify circuit design and reduce equipment cost and complexity.

Type MS Power Film Resistors provide all these features in a single resistor:

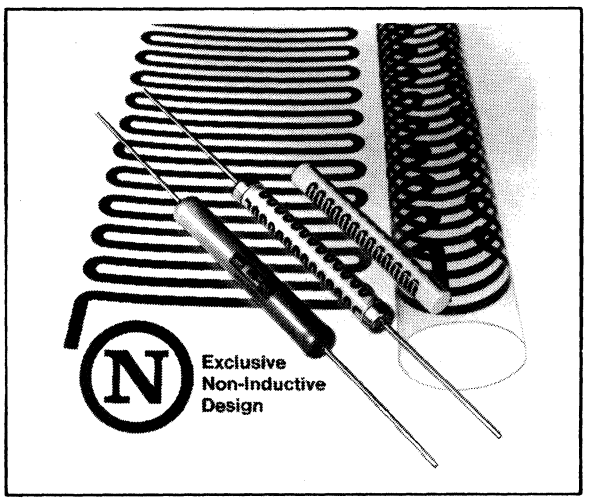
- Full power and voltage ratings, without derating —
  - for non-inductive performance.
  - for high resistance values that extend the critical resistance value up to 10 times.
- Higher voltage ratings without the limitations of minimum wire size and spacing.
- Excellent long-term stability.
  Tests demonstrate typical stability of 0.05% per 1000 hours over extended life.

Micronox® Resistance Films

Type MS performance begins with Micronox® resistance films, the basic element in every Caddock resistor. Produced exclusively by Caddock Electronics, these proven complex oxide films have been used reliably for 20 years in Caddock's precision power resistor products.

Micronox® resistance films are fired directly onto a ceramic core, in air, at 1400° F. These resistance films have demonstrated outstanding stability when exposed to a high ambient temperature, thermal shock and high power densities.

This unique approach to precision power resistors opens new design possibilities by providing wider resistance range, precise temperature characteristics, and higher temperature and power handling capability.



There's no derating of performance with Caddock's Exclusive Non-Inductive Design.

Most models are manufactured with Caddock's patented Exclusive Non-Inductive Design which uses a serpentine resistive pattern that provides for neighboring lines to carry currents in opposite directions, thereby achieving maximum cancellation of flux fields over the entire length of the resistor. This efficient non-inductive construction is accomplished without derating of any performance advantages.

The result is a truly non-inductive resistor that is about as inductive as a straight piece of wire the length of the resistor body. This efficient design means faster setting times and minimum distortion in all types of high frequency circuits.

Carefully Controlled Manufacturing and Test Procedures Assure Compliance with Strict Quality Control Requirements

Manufacturing Control

In addition to these procedures, all Type MS Resistors are produced under strict manufacturing controls with processes which include power conditioning, overvoltage conditioning and maximum temperature conditioning.

Quality Control

From the certification and testing of all materials to the supervision of manufacturing processes, all Caddock Type MS and MR Power Film Resistors are produced under procedures that have been approved for conformance to the requirements of NASA NHB5300.4(1C) and MIL-I-45208 in many recent surveys.

Reliability Verification

Type MS Resistors are included in the Caddock Reliability Testing Program. Conformance to specification parameters including Extended Life, Shock, Vibration and Humidity are verified on a periodic basis. Data from MS resistors can be compared by similarity to other Caddock resistor types, since Type ML, MM, MS, MP, MG and MK represent an identical combination of materials —aluminum oxide substrate, Micronox® resistance film and silicone insulating coating.

HIGH PERFORMANCE FILM RESISTORS

Type ML & MM Precision Film Resistors

High-Temperature Resistors for Geophysical, Aerospace and Industrial Requirements.

Type MM and ML resistors have a proven performance history in industrial, computer, military and space applications. With power ratings up to 3 watts and resistance values to 15 Megohms, these outstanding resistors are ideal for applications requiring tolerances as close as 0.1% and extended life stability of 0.1% per 1000 hours.

CADDOCK
HIGH PERFORMANCE FILM RESISTORS

Type MK Precision Power Radial-Lead Film Resistors

Radial-Lead Resistors with Resistance Range from 10 ohms to 100 Megohms.

Here are the low cost precision resistors that provide high density packaging in large volume printed circuit applications. Available in two miniature rectangular package configurations with standard lead spacings, Type MK Precision Film Resistors now cover the entire resistance range from 10 ohms to 100 Megohms.

Constructed with Caddock Micronox® resistance films fired onto a solid ceramic substrate, Type MK Precision Film Resistors combine all of these outstanding advantages:

- **±1% resistance tolerance is standard** - tolerances to ±0.1% are available on special order.
- **Operating temperatures** - from -55° C to +175°C.
- **Full power rating at +125° C.**
- **Temperature Coefficient is only 50 PPM/°C up to 10 Megohms and 80 PPM/°C up to 100 Megohms** - referenced to 25°C with the ΔR taken at -15°C and +105°C.
- **Extended life stability is typically better than 0.1% per 1000 hours.**
- **Caddock's Non-Inductive Performance** - provides faster settling times and minimum distortion in all types of high frequency circuits.

This combination of performance advantages in a small, standardized case can simplify many engineering and production problems:

One size of Type MK resistor can replace many sizes of axial lead resistors.

This table of "RN" style axial lead resistors shows the many sizes and power ratings that can be replaced with either of the two models of Type MK Precision Film Resistors within the maximum allowable voltage ratings.

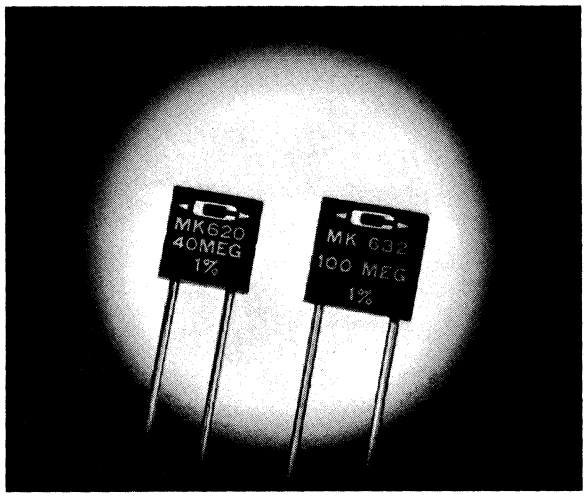
Comparison of Type MK and "RN" Ratings and Dimensions

Resistor Type	Power Rating	Maximum Resistance	Mounting Hole Spacing	
MK 120 or MK 620	**.50 WT.**	**40 Megohms**	**.150**	Even the smallest Type MK resistor can replace all of these RN type resistors.
MK 132 or MK 632	**.75 WT.**	**100 Megohms**	**.200**	
RN50	.05 WT	1 Megohm	.400	
RN 55	.10 WT	5 Megohms	.500	RN 55
RN60	.125 WT	10 Megohms	.625	RN 60
RN65	.25 WT	20 Megohms	.875	RN 65
RN70	.50 WT	40 Megohms	1.000	RN 70

All outline drawings full size — dimensions in inches.

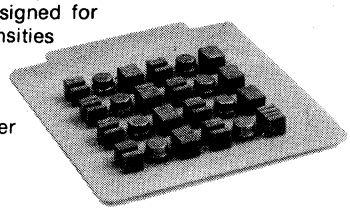
The largest Type MK — rated at .75 watt — requires less board space than even the 1/20th watt RN50.

The smallest Type MK — rated at .5 watt — provides power dissipation **equal** to the RN70 resistor. The RN70 resistor requires a mounting hole spacing of 1" and a side-to-side spacing of .250 inches, resulting in a total mounting area of .25 square inches — **10 times the area required for a .75 watt Type MK resistor!**



One standard resistor configuration can simplify board layouts.

With the exceptionally wide range of resistances that are available in each model of Type MK Precision Film Resistors, circuits can now be designed for maximum packaging densities without the need for leaving extra space where resistor value changes can require larger resistors or non-uniform lead spacings.



Standardization of resistor size can speed assembly procedures and reduce procurement costs.

The standardization of resistor size can pay additional dividends by simplifying assembly procedures. The radial leads do not require additional bending prior to insertion, and the standard lead spacing can reduce the time required for assembly.

The combination of higher power rating and smaller size can also lower procurement costs. By reducing the wide variety of sizes and types of axial lead resistors to a single, standardized resistor type, unit prices can be lowered and inventory problems simplified. HIGH PERFORMANCE FILM RESISTORS

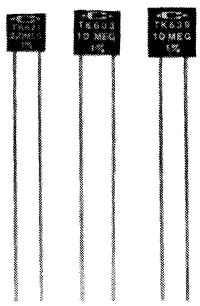
Type TK Low TC Precision Radial-Lead Film Resistors

Small Package with Low TC of 10 PPM/°C and Resistance Range from 1 kohm to 10 Megohms.

Caddock introduces a new design element for precision electronic circuitry — an advanced technology breakthrough that solves many critical circuit stability problems — the **Type TK Low TC Precision Radial-Lead Film Resistors with the Tetrinox® resistance system.**

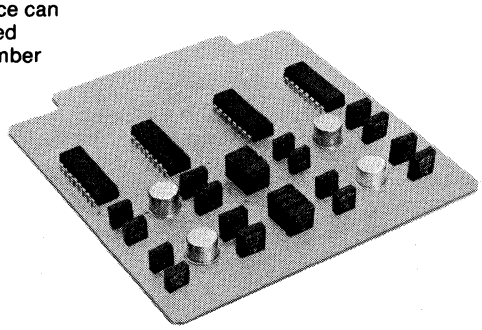
Type TK Low TC Precision Radial-Lead Film Resistors provide a combination of performance advantages never before available in a resistive component:

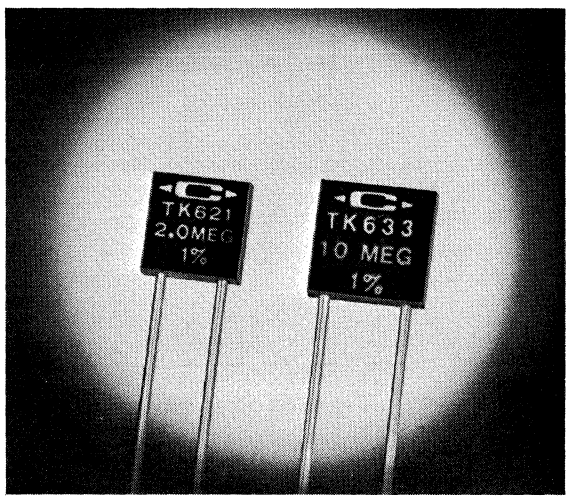
- **Temperature Stability** – better than 10 PPM/°C over the entire temperature range from −55°C to +125°C!
- **Long-Term Absolute Stability** – better than ±0.05% per 2000 hours of operation.
- **Extended Resistance Range** – from 1000 ohms to 10 Megohms.
- **Precision Tolerances** – ±1% is standard, and tolerances as close as ±0.05% are available.
- **Wide Operating Temperature Range** – from −55°C to +175°C.
- **Small Size** – with three miniature rectangular cases for maximum packaging density and minimum mounting area.
- **High Power Density** – with power ratings of .2 watt and .3 watt in molded cases, the largest of which is a standard CK 06 package.



(Photos show resistors full size)

- **Caddock's Non-Inductive Performance** - provides faster settling times and minimum distortion in all types of high frequency circuits.
- **High Density Packaging** - the radial-lead mounting and small rectangular case of the Type TK resistors permits high packaging densities in low profile circuitry. And because the three models of the Type TK resistors are available in an exceptionally wide range of resistance values, lead spacing and mounting space can be standardized in a larger number of designs.





Building on over 20 years of experience with our unique complex-oxide technology, Caddock has perfected the Tetrinox® resistance system — the first high resistance system to provide a TC that is well within 10 PPM/°C and that is also essentially linear over the entire temperature range from -55°C to +125°C.

The exceptional performance of Type TK resistors can achieve improvements in many circuit applications:

Low TC "Matched-Pair" Voltage Dividers Can be Assembled Without Pre-Selection of Resistors.

An important application for Type TK resistors is in "matched-pair" voltage dividers where the low 10 PPM/°C temperature coefficient provides ratio tracking of less than 20 PPM/°C without resistor pre-selection or special testing.

With factory selection, Type TK resistor pairs can be matched to within 1 PPM/°C.

Extended Resistance Range Reduces Power Requirements

Because the Type TK resistors provide resistance values as high as 10 Megohms — values that are up to 100 times higher than other types of ultra-low TC resistors — engineers can now design precision circuits with lower current drain and lower power requirements.

The design flexibility achieved by Caddock's advanced resistance film technologies is extended to low resistance values in precision resistor networks through the application of Caddock's Micronox® resistance films.

By applying this technology to the low-profile, single-in-line package configuration, the Type 1789 Custom Low Resistance Value Precision SIP Resistor Networks provide this unique combination of performance specifications:

- **Resistance Values:** from 0.5 ohms to 10,000 ohms.
- **Absolute Tolerances:** ±1.0%, ±0.50%, ±0.25%, ±0.20%, ±0.10% and ±0.05%.
- **Ratio Tolerances:** ±1.0%, ±0.50%, ±0.25%, ±0.20%, ±0.10% and ±0.05%.
- **Absolute Temperature Coefficients:** 100 PPM/°C, 80 PPM/°C and 50 PPM/°C from 0°C to +70°C.

Where high accuracy and low resistance values must be combined - as in high accuracy current measurement circuitry - Kelvin terminations can be provided for low resistance values to minimize lead resistance errors.

The optimum design of Type 1789 Custom Low Resistance Value Precision SIP Resistor Networks is best achieved when the performance of Micronox® resistance film technologies is blended with particular circuit specifications and the unique thin-profile, single-in-line package design to arrive at the final network package size, pin spacing and pin style.

Applications for the Type 1789 Custom Low Resistance Value SIP Precision Resistor Networks include -

- **Current Summing Networks**
- **Precision Termination Networks**
- **Precision Current Shunts**
- **Current Sensing Networks**

Type MP Chassis Mounted Power Film Resistors

Type MP Chassis Mounted Power Film Resistors are made with Micronox® resistance films fired onto a ceramic substrate which is thermally bonded to an anodized aluminum base. By mounting this assembly directly to a metal surface for improved heat transfer, the high power capabilities of these unique resistors can provide increased packaging densities in many types of electronic equipment.

The special performance features of the Type MP Power Film Resistors include:

- Two case sizes that provide 15 watt and 30 watt ratings.
- Single-screw mounting to simplify attachment to the chassis or other heat conducting surface.
- A molded silicone case that encapsulates the resistor assembly to meet stringent environmental specifications.
- Extended-life stability better than 0.01% per 1000 hours has been demonstrated through a 5½ year, 50,000 hour program of continuous load-life testing.

Detailed information on power ratings versus ambient temperature and chassis area has been provided on this page. A detailed report on the results of extended-life stability tests is available from the applications engineering group at Caddock Electronics, Inc.

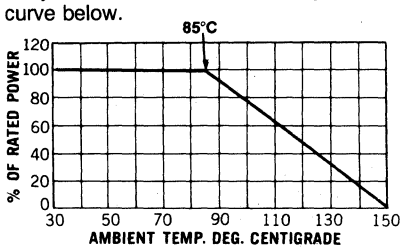
DERATING

Dale PTF resistors have an operating temperature range of −55°C to +150°C. They must be derated according to the curve below.



MATCHED SETS — NETWORKS

Dale's many years of experience in matching resistors for sets and networks, combined with the superb performance of the PTF product, provide the best and most economical solution to your precision resistor requirements. Why? Because most applications for precision resistors depend on two or more discretes having an initial tolerance ratio and a resistance tracking capability over temperature rather than each discrete resistor meeting the absolute requirements of the application.

Cost savings approaching 50% can be realized when relatively tight matching requirements are specified while permitting the absolute parameters of the discrete resistors to have more relaxed specifications.

Dale application engineers are available to assist you in specifying your requirements in the most economical way possible.

The industry's most complete selection of discrete resistors.
■ COMMERCIAL ■ INDUSTRIAL
■ PRECISION ■ ESTABLISHED RELIABILITY

TO USE: Resistors are listed by power rating. Locate the wattage which matches your requirement, then match with the Dale Type closest to your needs in T.C. value, tolerance, etc. In addition to these standard resistors, many nonstandard versions are available or can be engineered to match your needs. For more information and assistance, you will find factory addresses at the end of this guide.

(2) Where 20 PPM is specified on wirewound resistors, it applies to 10 ohms and up. 1-9.9 ohms = 50 PPM, .1-.99 ohms = 90 PPM. (3) MF (Metal Film), OF (Oxide Film), MO (Metal Oxide), CF (Carbon Film), WW (Wirewound). (4) Other values available, consult factory. (5) On HL and CW resistors, standard tolerance is 10% below 1 ohm.

DALE® GOVERNMENT SOURCE INSPECTION AND FEDERAL SUPPLIERS CODES

GOVERNMENT SOURCE INSPECTION

If Government Source Inspection is required, it should be called out on the purchase order along with the complete Government Contract Number.

Qualified Standard Part Value Selection and Deviation: If you are ordering a qualified standard part, be sure that it is a standard resistance value and a tolerance in the specification. When ordering military parts, check the Dale QPL list to assure qualification status, value range and tolerances. If any requirements exceed or do not conform to specifications for the standard qualified part, include authorization for specific deviations with purchase order. Government Source Inspection can be requested on any item manufactured by Dale. It must, however, be requested by or under authorization of the government representative at your plant. Ref. Paragraph 3.11 of MIL-I-45208 or 3.5.3 of MIL-Q-9858.

DALE FEDERAL SUPPLIERS CODES	CODE NUMBER	MANUFACTURING LOCATIONS
Dale has several Federal Suppliers Codes that can be utilized on parts supplied to the government. The list at right gives the five digits that may be marked on the part in place of the Dale logo.	**91637**	Columbus, NE; Norfolk, NE; York, NE; El Paso, TX; Juarez, Mexico; Kaufbeuren, Germany

IRC SURFACE-MOUNT RESISTIVE PRODUCTS OPEN-UP A NEW WORLD OF APPLICATIONS.

Standard and custom devices — one source for all

From one source you can get virtually every type of discrete resistor and resistor network that can be produced in a surface-mount configuration. All fabricated with proven IRC materials and resistor elements — so reliable performance is a sure thing.

IRC was one of the first to offer surface-mount power wirewounds, and our RG Glaze® power chips are the smallest available.

Our TaNFilm® technology produces resistor networks with exceptional stability, tight tolerances, close TCR tracking, and low noise. These networks, and our chip resistors, also meet or exceed military requirements.

If your surface-mount design requires custom-adapted resistors, no problem. And no long wait, either.

We're the one source to know, as you move ahead into the world of surface-mount. For product specs or application assistance, contact us: IRC, Inc., Greenway Road, P.O. Box 1860, Boone, NC 28607. Phone 1-800-255-4-IRC. (In NC, 704-264-8861.)

PRECISION WIREWOUND RESISTORS

GENERAL RESISTANCE
A PRIME TECHNOLOGY COMPANY

1,500,000 resistors in stock — all manufactured to meet the most exacting standards of accuracy, stability and reliability.

General Resistance has been engaged in the development and manufacture of precision wirewound resistors for over 30 years. The widest possible range of form factors is available, including axial and PC mounting types, in resistance values and accuracies to meet virtually any requirement.

"Standard values" are normally available from stock. And *any* resistance value from 1Ω to 1,100,000Ω, as well as accuracies other than the "standard" ±0.1%, ±0.025% and ±0.01%, are available.

All General Resistance resistors are manufactured to the exacting standards typified by military specifications such as MIL-R-93/ MIL-R-39005 (RB and RBR styles).

FVOT-15	15	1	1 1/4
FVOT-20	20	2	2 5/16

NOTE: FVOT = VITREOUS

Miniature oval resistors, by their basic design, are ideally suited for applications where space is limited and the mounting surface can be utilized for heat dissipation purposes. Resistors can be easily stacked into compact units. Standard tolerance is ±5% for 1 ohm and greater and ±10% for less than 1 ohm. Ayrton-Perry type non-inductive winding is available.

FVOT-75	95	6	6 3/4	7 1/4

NOTE: FVOT = VITREOUS
FSOT = SILICONE

Standard oval resistors, like the miniature ovals are easily stacked and utilize the mounting surface as a heat-sink. When stacking two or more parts, the individual resistors should be de-rated. Standard tolerance is ±5% for 1 ohm and greater and ± 10% for less than 1 ohm. Ayrton-Perry type non-inductive winding is available.

KELVIN

Precision Wire-wound Resistors, Power Resistors & Resistor Networks

Kelvin is a pioneer in the field of very high stability, close tolerance, precision wire-wound resistors. Resistors shown represent only part of the broad Kelvin line. Complete catalog data is available on request.

HIGH RELIABILITY "HRL" SERIES

Kelvin's "HRL" Series was generated after years of experience on the Polaris, Gemini, Apollo and other important high reliability missile and space programs. Kelvin has combined the many and varied parameters of these programs into a single resistor series, designed to meet the stringent high reliability requirements of many of today's military and commercial systems.

Kelvin's reliability goal, through the design and controls of the "HRL" Series resistor and the use of acceptance inspection procedures, was to produce precision wire-wound resistors having failure rates better than .0005%/1000 hours at a 90% confidence level. Present level is .00064%/1000 hours at a 60% confidence level.

All "HRL" resistors have a documented history. This includes traceability from the spool analysis of the resistance wire, through each phase of the production operation to the finished product. Each resistor is screened to eliminate INFANT MORTALITY. This consists of a 100 hour burn in at full rated power at 125°C and a short time overload at twice the rated power. Other tests are conducted as outlined in Bulletin HR 02449, which presents the complete procedure and methods approach for production of "HRL" resistors.

SERIES KM-4T & KC-4T POWER RESISTORS

KELVIN FOUR TERMINAL POWER RESISTORS provide low resistance and close tolerance capabilities to users who require accurate measurements in tightly designed circuits. The two voltage (sense) leads will yield a very precise measurement at the points where they join the current leads. Lead resistance, which plays a predominant role in low ohm resistors, is virtually eliminated.

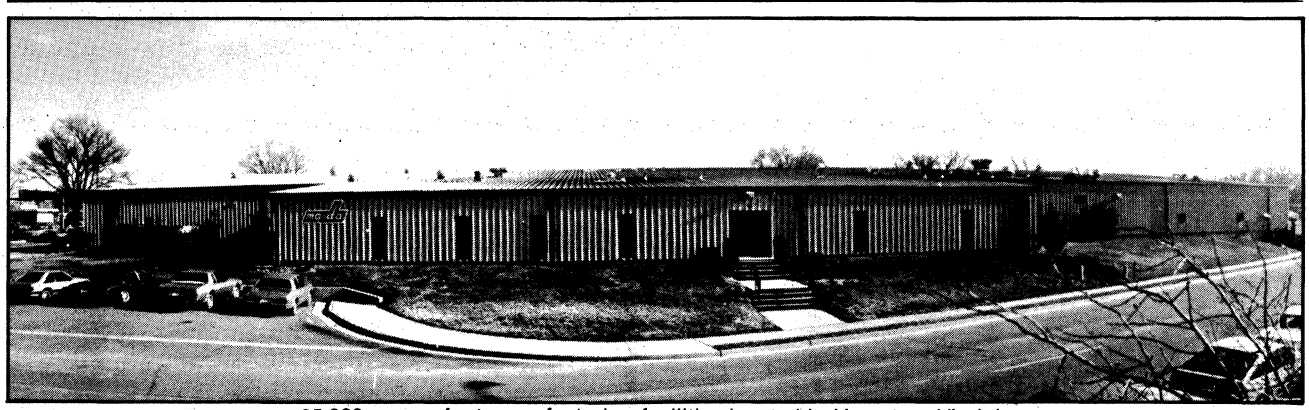
ZINC OXIDE VARISTOR

MAIDA DEVELOPMENT COMPANY
"CERAMIC COMPONENT MANUFACTURER SINCE 1947"



85,000 square foot manufacturing facilities located in Hampton, Virginia

Maida *Zinc Oxide Varistors*

Maida Development Company, domestically owned and operated, has served the electronics industry with a wide variety of ceramic components. We specialize in custom design and manufacturing, from ceramic powder formulation through finished devices, to meet specific requirements of our customers. Typical capacitor products include (1) high voltage capacitors for power supplies; (2) UL and CSA recognized capacitors for across-the-line, line-by-pass, and antenna coupling uses; (3) reduced titanate capacitors for low-voltage general purpose applications; (4) leadless discs; (5) slot-mounted "trapezoids" for printed circuits; and (6) multilayer capacitors. Our newest product line - zinc oxide varistors (ZOV) is designed for transient voltage suppression and surge energy absorption and many are UL recognized. Our delivery is timely and reliable-with either bulk packaging or tape and reel. We value with pride the repeat business from such customers as GE, Zenith, RCA, IBM, AT&T, Xerox, Sunbeam, GTE, NAP, Kodak, Harris, Allen-Bradley and many others.

SERIES 9C COMMERCIAL CHIP RESISTORS

SMD (chip) resistors consist of a ceramic body (alumina) on which is deposited resistive paste. Variations in the composition of the paste result in different resistant values. A wrap around termination is deposited at each end of the resistor to allow reflow or wave soldering. The resistive layer is covered with a protective coating to assure mechanical and environmental integrity.

CONSTRUCTION

Premium grade resistance wire is wound on a woven fiberglass core. Tinned copper terminals are tightly crimped or welded (depending on resistance value) to the banded core. The wound unit is potted in a high quality Steatite Ceramic case using a high temperature, high thermal conducting inorganic potting compound. This results in a completely fireproof inorganic package, highly resistant to solvents and impervious to moisture.

Stand off or feet type available in sizes 3 Watt and larger. Specify by inserting letter "F" after type number. Example: CW5F

APPLICATIONS
Jumper wires or crossovers, as they are sometimes called, are basically interconnection devices between points on a PC board.
Generally they are used for the following reasons:
- Inability to connect two points on a PC board due to other circuit paths which must be crossed over.
- An after-the-fact design change that requires new point connections.
- Circuit tuning by changing point connections.

VITREOUS ENAMEL RIBWOUND RESISTORS

BASIC CONSTRUCTION

Crimped ribbon resistance wire is edgewound and then locked to the ceramic core with vitreous enamel. The resistance wire is spot welded to the terminal bands. MRC Ribwounds can be supplied in fixed, adjustable, or tapped styles. Cement or silicone coatings are optional.

HI-OHM RIBWOUNDS AN EXCLUSIVE WITH MRC

In the chart below, note that the maximum ohmic value shown for each wattage is 3 to 4 times higher than that normally available. This development is the result of precision rib winding machines designed specifically by MRC. Unique in the industry, these precision machines produce a winding with extreme uniformity. This allows much closer turns providing significantly higher resistance.

Hi-Ohm Ribwounds can replace lower ohmic value roundwire power resistors with savings in size.

OHMS	OHMS	OHMS
0.1	1.0	6.0
0.15	1.25	8.0
0.2	1.5	10.0
0.25	2.0	12.0
0.4	2.5	15.0
0.5	3.0	20.0
0.6	4.0	25.0
0.75	5.0	33.0

Many 300 watt units are stocked in both fixed and adjustable styles. Listed are the more popular 300 watt ohmic values. All other wattage ratings and styles are made to order.

APPLICATIONS

Recommended for use where high energy is to be dissipated in the lower ohmic ranges. With its ability to dissipate greater heat, the ribwound resistor is almost one half the physical size of an equally rated roundwire.

Ribwound wattage ratings are based on a temperature rise of 375°C above an ambient of 40°C.

They can be mounted with spring clips (thru 1⅛" dia.); thrubolt hardware, individual or multiple-stacked bracket assemblies or live-bracket assemblies.

EDGEWOUND POWER RESISTORS

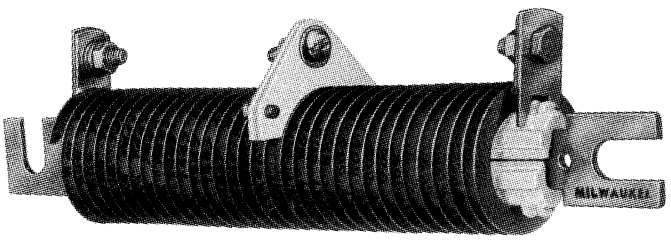
EDGE·POWER



HIGH CAPACITY GOOD WEIGHT/WATTAGE RATIO

New **EDGE-POWER** resistors complement Milwaukee Resistor's roundwire, ribwound and grid resistors which have been the industry's workhorse of electrical power dissipation for many years.

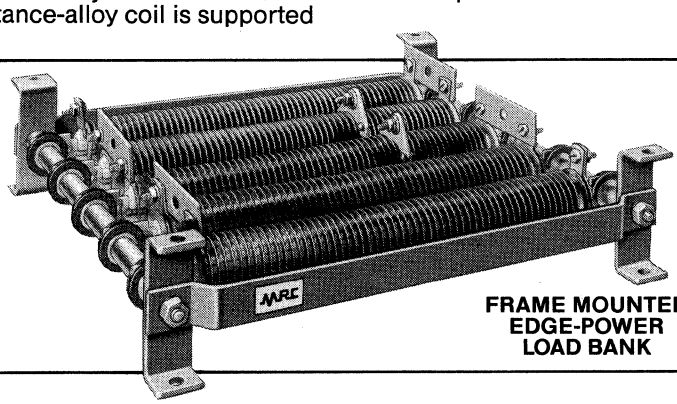
A continuous range of resistor types are now available for your high current applications. EDGE-POWER falls naturally between MRC's ribwound and grid resistors and allows full design versatility from one source.

Because of the open coil construction of EDGE-POWER resistors, heat dissipation is efficient, and reasonable surges/overloads are easily accommodated.

The heavy duty resistance-alloy coil is supported on specially designed porcelain insulators which provide insulation and proper turn-to-turn spacing. The end-slot/side-slot support bar provides versatility in mounting and adapts easily to many existing installations.

Movable tap terminals are available as an option. Terminal hardware for cable attachment is provided as a standard item on all terminals and taps.

Frame mounted load banks (as shown below) can be furnished with taps and jumpers to meet your circuit specifications (series, parallel or combination). Your load bank inquiries are invited.



FRAME MOUNTED EDGE-POWER LOAD BANK

Typical Applications of **EDGE-POWER** resistors include motor control (starting, plugging, speed control and braking), load dumping, ballast, current limiting, and voltage dropping. Edgewound resistors are commonly found in:

- Overhead Cranes
- Locomotives
- Lift Trucks
- Plating Baths
- Elevators
- Power Supplies
- Arc and Spot Welders
- Battery Lines/Chargers
- Many Industrial Controls

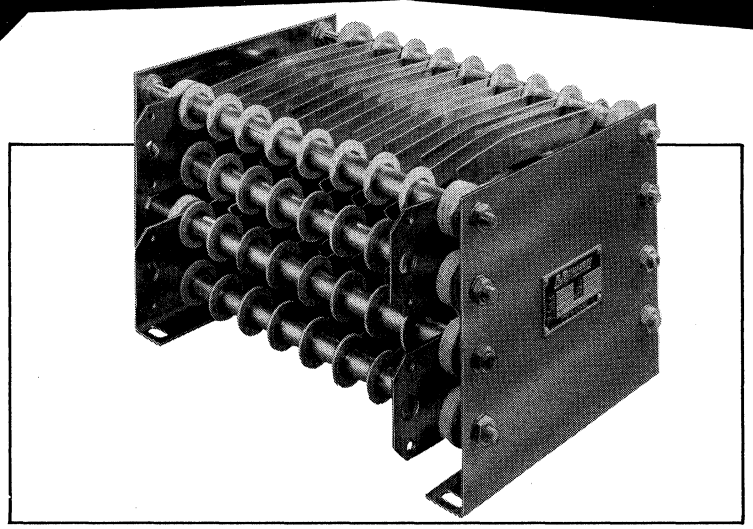
GRID RESISTORS



...For High Current and High Power Circuits

Milwaukee Grid Resistors are among the most versatile grid resistors developed. They are custom designed with the aid of a computer for specific applications.

Special features that assure longer life include: a patented* grid design that withstands overloads that would destroy conventional grids. Corrosion resistant stainless steel or special alloy elements. All-welded construction to eliminate hot spots and resistance fluctuations. Vibration-proof insulation that allows extended operation at higher voltages.

Taps and independent sections can be easily incorporated into the design to provide added flexibility. MRC grid units can be designed for use with natural convection cooling or with forced ventilation if size reduction is necessary.

They are competitively priced and incorporate more life and greater dependability than usually provided by conventional grid resistors.

MINI-SYSTEMS, INC., thick/thin film chip resistor components are ideally suited for the fabrication of microelectronic circuits where tight resistance tolerance, wide range of resistance values, or short production runs make the conventional screening and firing of thick/thin film resistance networks too costly. MINI-SYSTEMS, INC., chip resistors are made from a carefully engineered selection of materials. Geometries are mechanically precise and uniform. Careful testing and inspection result in the highest quality resistors.

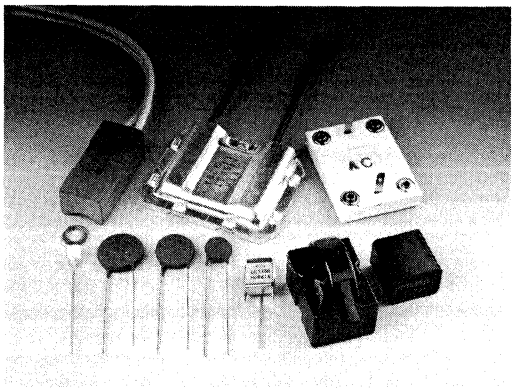
posistor® positive temperature coefficient thermistors

MURATA ERIE NORTH AMERICA

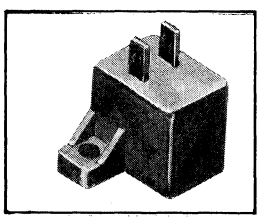


Murata Erie Posistors are basically positive temperature coefficient resistors with a very well defined resistance-temperature "knee" and the unique ability to "switch" relatively large amounts of power. They may also be used as self-regulating heating devices at useful power levels and as control devices for high power heaters. Applications include temperature sensing, over temperature and over current protection and motor starting to name a few.

Products utilizing Positors are extremely safe and reliable and offer all of the design, manufacturing, repair and sales advantages of solid state technology.

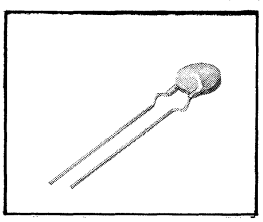
- Compact
- Reduced component count
- Extremely reliable
- "Stepless" temperature control
- Simple repair or replacement
- Long term reliability
- Shock and vibration immunity
- Nonflammable case and insulation available
- No electrical or acoustical noise
- No electrical contacts

FOR MOTOR STARTING



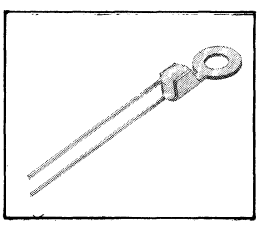
Provides a smooth, solid state electronic starting device for single phase motors utilizing a split-phase starting winding or for PSC motors as a direct replacement for starting capacitors and switches.

FOR CIRCUIT PROTECTION



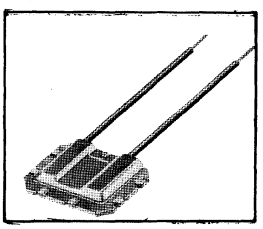
Provides overcurrent protection in a variety of applications. When connected in series with the protected device, Posistors limit the circuit current to a predetermined value — above that value they switch to a high resistance state and limit the current to a safe level.

FOR SEMICONDUCTOR OVERLOAD PROTECTION



Senses the case temperature of high power semiconductors and appropriately reduces the power dissipation when dangerous power or current levels are reached by switching to a high resistance state and reducing base bias current.

FOR HIGH POWER HEATING



Posistors for heating are self-temperature regulating with fast thermal response and power ratings to 170 watts.

NTC thermistors for surge current protection

Switching power supplies, CRT monitors, color TVs, and other power circuits need protection from extremely high surge currents. This protection can be realized with Murata Erie's power type NTC thermistors.

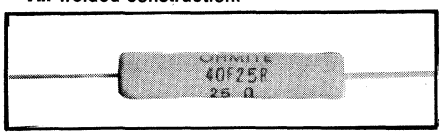
OHMITE®

Ohmicone® Silicone–Ceramic Conformal Axial Lead Wirewound Resistors
1% And 5% Tolerances

Features

- **Economical.**
- **Applications** include commercial, industrial and communications equipment.
- **Stability** under high temperature conditions.
- **All-welded construction.**



Ohmite's 40 Series resistors are the most economical conformal silicone-ceramic coated resistors offered. These all-welded units are characterized by their low temperature coefficients and resistance to thermal shock, making them ideal for a wide range of electrical and electronic applications.

Units with 1% and 5% tolerances are identical in construction and electrical specifications. Durable but economical 40 Series resistors exceed industry requirements for quality.

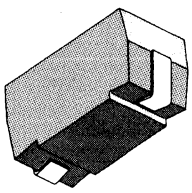
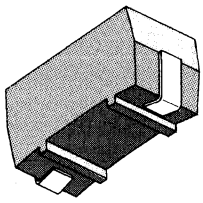
Ohmite Surface Mount Power Resistors

OHMITE®



Pedestal mount design is ideal for wave soldering.



Recessed foot mount design is ideal for reflow soldering.

Features

- Replaces an entire series of lower wattage chip resistors, saving real estate.
- Available in 1.5- or 2.5-watt power ratings in wirewound or film construction. (Other ratings under development.)
- Increased reliability. Ratings are determined by temperatures on the circuit board at the solder junction, not the hot spot.
- Patent-pending, flexible J-bend terminations to reduce the chance of solder joint breakage due to thermal expansion.
- Rectangular shape lends itself to applications with pick-and-place equipment.

With Ohmite Surface Mount Resistors, not only do you save room in circuit board real estate, but you save money in simplified design and easy manufacturing. Select film resistors for general purpose applications. Specify wirewound models for applications requiring lower resistance values, tighter tolerances, or lower temperature coefficients.

200 Type Brown Devil® Fixed Resistors

OHMITE®

***Brown Devil*®** (Type 200) resistors, are vitreous enameled, wirewound units long famous for ruggedness and durability in small power resistors. With the emphasis toward miniaturization and the current industry trend toward high operating temperatures, Ohmite has been able to increase the ratings on two Brown Devil sizes. The 5 watt size is now rated 8 watts and the 10 watt size is now rated 12 watts. The 20 watt unit retains the same rating.

Available on special order in 3 watt size and in values other than those listed as standard. Also available on special order with radial leads for P-C board mounting.

Standard resistance tolerance is ±5% for values 1 ohm or higher; ±10% for values below 1 ohm. Tinned leads 1½" long: 3 and 5¼ watt, 20 AWG; 8, 12 and 20 watt, 18 AWG.

270 Type Vitreous Enameled Fixed Resistors

OHMITE®

These lug type resistors are wire-wound on high quality ceramic cores, protected and insulated by Ohmite vitreous enamel — the time-proved standard covering that is the best conductor of heat for a material which must also be a good electrical insulator.

Resistance tolerance is ±5% for values 1 ohm or higher; ±10% below 1 ohm.

Wattage ratings are for use in free air. When resistors are mounted in closed spaces or where the circulation of air is restricted, they should not be used at more than one-half rating. Currents and voltages for reduced ratings can be obtained by multiplying full rating by the following factors: 75% load = .86, 66% = .81, 50% = .71, 33% = .57, 25% = .50.

Higher wattage resistors are available on a custom manufactured basis. Call for information.

These items are also available on special order, with non-inductive windings, (Aryton Perry).

The resistors listed below are standard stock items only. The 270 resistors are also available, on special order, in wattages from 3 through 1,000 with many intermediate values. Resistance values can also be supplied to meet your specific requirements. Contact our field representatives or our application engineers for assistance.

210 Type Dividohm® Adjustable Vitreous Enameled Resistors

OHMITE®

Dividohm resistors make ideal voltage dividers for original equipment and replacement in transmitters, rectifiers and other apparatus. Such tapped "bleeders" are made by using one or more adjustable lugs, as required. ***Dividohm*** are also handy for obtaining odd resistance values, for adjusting circuits, and for use on equipment which must be set to meet various line voltages.

Dividohm resistors are vitreous enameled resistors on which a narrow strip has been left uncovered to expose a portion of each turn. Contact to any wire in this strip is made by an embossed contact on the adjustable lug (supplied).

WATT RATING: The stated wattage rating applies only when the entire resistance is in the circuit. When the adjustable lug is set at an intermediate point, the wattage rating is reduced in approximately the same proportion, i.e., if the lug is set at half the resistance, the wattage is reduced by one-half. A safe rule to follow is to make sure that the maximum rated current is not exceeded. This should be carefully checked particularly if the resistor will be used as a voltage divider with several adjustable lugs. Resistance tolerance is ±10% for the total resistance value.

The items listed in the chart below, are those items that have proven to be the most popular based on usage. "Dividohm" style resistors are available on special order in resistance values other than those shown and in a wattage range of 12 Watts through 1000 Watts. In addition to the vitreous enamel standard coating, these items are also available with an Ohmicone silicone ceramic coating.

For any variable or adjustable resistor requirement, contact your Ohmite field representative or our application engineers.

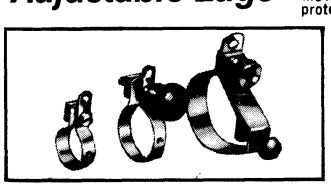
Adjustable Lugs

One "Screw Driver Type Adjustable Lug" is supplied with each unit. Lugs with a silver contact button can be ordered from the table below. MOVING THE LUGS: Lugs always should be loosened completely before moving and not moved except while the current is off, in order to protect the exposed wire from mechanical or electrical injury and to protect the operator from dangerous voltages.



DOUBLE THUMB SCREW ADJUSTABLE LUG

This adjustable lug, which is illustrated at left, features two advantages — ease of adjustment and less chance of damaging the resistance wire while moving lugs. Available for 1⅛" cores.

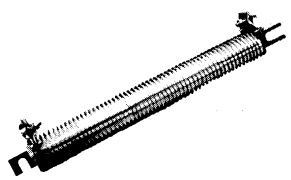
Powr-Rib® Edgewound/Round Wire Power Resistors

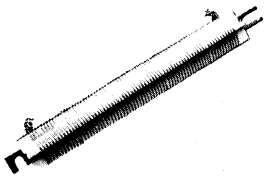
OHMITE®

Features

- **Rugged** construction withstands shock and vibration.
- **Thick** metal and porcelain construction.
- **Extremely** high power capacity, from 700 to 1000 watts as stock models.
- **Edgewound** designed for very low resistance and high power capacity.
- **Round wire** designed for higher resistance with lower power capacity requirements.



Edgewound



Round Wire

Ohmite's largest and most rugged stock resistors, Powr-Ribs, are designed to handle 700 to 1000 watts of power (up to 1600 watts on special order). Their construction consists of heavy resistance alloy wound around ceramic insulators supported by a metal mounting bar. The bar is slotted on each end to facilitate installation

Clamp-type terminals on the Edgewound units permit a reliable connection which can be moved along the resistive element to obtain intermediate values.

Edgewound Powr-Ribs provide low resistance at high current ratings, while Round Wire Powr-Ribs produce higher resistance at lower current ratings.

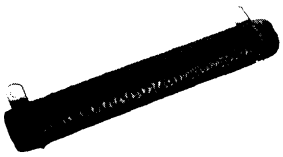
Corrib® Fixed Adjustable Vitreous Enamel Power Resistors.

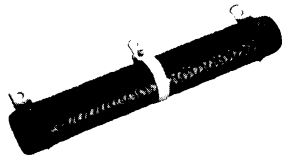
OHMITE®

Features

- **Ribbed** construction aids in rapid cooling.
- **Designed** for equipment requiring low resistance loads at low ohmic values and high current capacity.
- **Especially** constructed for motor starting, dynamic braking, etc.



Fixed



Adjustable

Corrib resistors are ideal for applications involving high currents at very low resistance values—as low as 0.1 ohm for the 300 Watt units. These large, heavy-duty resistors are designed to withstand frequent start-stop cycles characteristic of motor starting, dynamic braking and other similar applications. Special order units are available to accommodate up to 1500 watts.

Corribs are manufactured with corrugated resistive wire. To accelerate cooling, the wire is securely fused to the ceramic core by a protective vitreous enamel coating to improve durability. Corrib resistors are hollow-core units which can be securely fastened to chassis surfaces with thru bolts and brackets.

PowrFilm®

OHMITE®

Metal Alloy Film Resistors 5% Tolerance

Features

- **High** power to size ratio.
- **Economical.**
- **Endures** continuous full loading with very little change in value over time.
- **Excellent** applications where compact, space saving resistors are required.

PowrFilm resistors offer a major advantage over comparable metal film, carbon composition and fiberglass core wire types; a high power to size ratio. These resistors can dissipate 1.6 watts in a size smaller than a comparable ½ watt resistor and 2.5 watts in a package smaller than a comparable 1 watt unit.

PowrFilm is a high quality resistor constructed with a metal film alloy deposited on a high grade ceramic body. A non-flammable coating provides for environmental and electrical protection.

PowrFilm resistors are an excellent choice for large volume, cost sensitive applications requiring a high quality resistor that approaches the initial accuracy and long term stability of wirewound resistors.

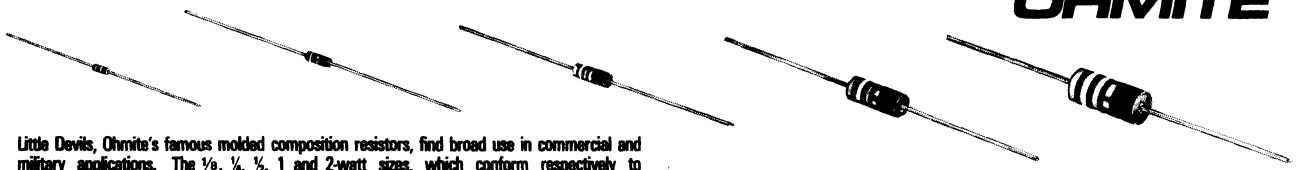
Little Devil® Molded Composition Resistors 5% Tolerance

OHMITE®



Little Devils, Ohmite's famous molded composition resistors, find broad use in commercial and military applications. The ⅛, ¼, ½, 1 and 2-watt sizes, which conform respectively to Styles RC05, RC07, RC20, RC32 and RC42 of MIL-R-11, meet all the stringent requirements of this military specification. All sizes available satisfy a wide range of design and service needs.

Little Devils have molded insulation for high dielectric strength. Noted advantages of these units are great stability, low noise level, low voltage coefficient, high insulation breakdown voltage and rapid heat dissipation. They may be used at full rated wattage at 70°C (158°F) ambient temperature.

Little Devils are available from stock in standard EIA resistance values in the tolerances and resistance ranges shown in the price table. Ratings for maximum continuous RMS voltage drop are high: 150 volts for ¼ watt units, 250 volts for ¼ watt, 350 volts for ½ watt, 500 volts for 1 watt, and 500 volts for 2 watt units.

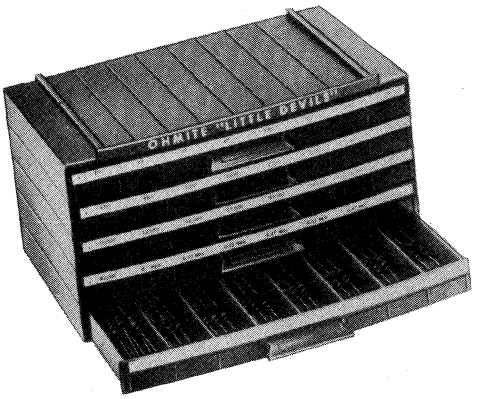
Cabinet Resistor Assortments

OHMITE®



Perfect for R & D and prototype labs.
All popular values included.
8 wattage sizes to choose from.
Contents clearly marked on front of each drawer segment.

Always have the right style, wattage, and resistance value on hand. Thwart Murphey's Law which states; "The resistance value needed will not be available."

Ohmite cabinet assortments come in four different resistor styles and 8 different wattages. The resistors used to make up these assortments are the most popular resistance values as determined by national usage.

The handy compact plastic cabinets are packed in accordance with the tables below, which state the quantities, number of values, and the resistance range of each assortment. Each drawer segment is individually labeled. Dovetail tops and bottoms of each cabinet facilitate stacking. Individual cabinet dimensions are: 9″ long by 4¾″ high by 5¼″ deep.

For specific information regarding any of the cabinet assortments, ask your Ohmite Distributor for the latest cabinet brochure.

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $5.00 for postage and handling. An invoice will accompany your System.

Don't waste any more time. Get organized now!

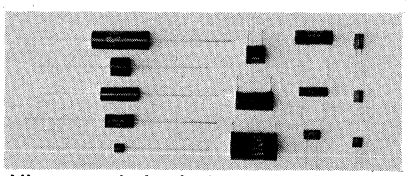
MOLDED PRECISION WIRE WOUND RESISTORS



TYPE AP: AXIAL PRECISION
TYPE LP: LUG PRECISION
TYPE RP: RADIAL PRECISION
TYPE RPC: RECTANGULAR PRINTED CIRCUIT
TYPE PC: PRINTED CIRCUIT

All are non-inductively, reverse Pi wound at minimum wire tension for maximum long life stability. All production is aged before calibration for insurance of minimum long-term load-life drift. Due to advance winding techniques and design they have extremely low rise time characteristics approaching film type resistors. Through matching of materials, resistance changes from temperature expansion rates is eliminated. Zero voltage coefficient and low noise characteristics. Leads are solderable or weldable. TC of 15 PPM/°C standard. TC of 2 PPM/°C to 6000 PPM/°C available. All bridges and other instrumentation used in calibration are periodically checked against National Bureau Primary Standards. Designs exceed Mil-R-93 and Mil-R-9444. Distinct capabilities for: Special Networks; Matched Sets; Voltage Dividers; Molded and encapsulated Modules.

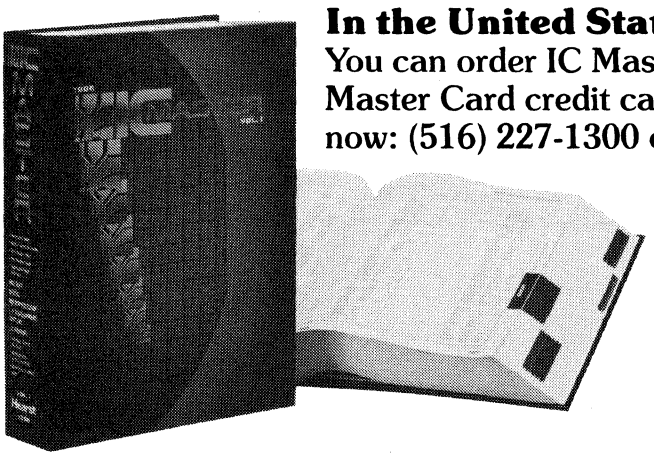
IC MASTER BELONGS ON YOUR BOOKSHELF

If you don't have your own IC MASTER, you can obtain your own copy by ordering now. Write for your own copy or order by telephone as described below.

IC MASTER is a two-volume set of technical data carefully organized to direct the engineer to the integrated circuits and related products that are closest to his specific needs. It is the surest and fastest way to find the optimum devices to answer an engineering design requirement. By ordering now, you won't have to borrow or search for IC MASTER the next time you need it.

Typical Use of IC MASTER
Can an engineer find out who makes a 256K dynamic RAM with an access time of 120 nanoseconds or faster in less than 30 seconds? He can if he turns to the Memory section of IC MASTER and looks for the 256K organization (words and bits per word) that he needs. Because each device is listed in order of access time, he can easily determine the devices that satisfy his speed requirements.



In the United States only:
You can order IC Master simply by charging it to your VISA or Master Card credit card. To place your order (USA only) call now: (516) 227-1300 or (408) 249-6800.

CUSTOMIZED RESISTOR SETS AND NETWORKS

Because of the high consistency and uniformity of the film deposition process and the high, repeatable accuracy of automated trimming equipment, descrete film resistors are available in matched pairs, multivalue sets and discrete networks with high precision and very dependable performance at reasonable cost. Resistance values, tolerances, temperature coefficients, as well as the matching and/or tracking of these parameters, can be specified and meet to exceptionally high degrees. The optimum range for the tightest requirements is 100 ohms thru 100,000 ohms, but 10 ohms thru 1 megohms is a practical range for less stringent requirements.

NOTE:
Cost savings can be realized when relatively tight matching requirements are specified while permitting the absolute parameters of the discrete resistor to have more relaxed specifications.
Application engineers are available to assist you in specifying your requirements in the most economical way possible.
Please contact the factory for complete information.

CONSIDER THESE INNOVATIVE FEATURES:

1 WIDE RESISTANCE RANGE
"Widest in the industry" any ohmic value or decimal part of an ohm from 0.02 ohm to 4 megohms.

2 DEPENDABLE TOLERANCES
Small quantity lots, as well as, competitive high volume production quantities are accurately checked 100% to assure specified limits... ±1% (Std.), ±0.5%, ±0.25%, ±0.1% and ±0.05% resistance tolerances.

Call us about your design requirements and questions. Engineering samples are available for testing and evaluation.

3 STABILITY VS. TEMPERATURE CHARACTERISTICS
Carefully selected materials/processes & quality control procedures insure low temperature (TCR) and power coefficients. **Standard:** Zero ±10 ppm/°C 100Ω and above. Zero ± 15 ppm/°C below 100 ohms. **Special** to ±2 ppm.

ENGINEERING DATA:

1 RESISTANCE RANGE AND TOLERANCE

Special: 0.005 ohm through 0.01 ohm with microhm tolerances to ±0.1%. (See resistance vs. tolerances graph above)

3 STABILITY VS. TIME CHARACTERISTICS (No Load)

To ±0.001%/year @ 25°C.

4 SOLVENT RESISTANT COATING

. . . with indelible marking.

5 PRECISION POWER RATINGS

Minimum resistance values @ full power ratings are based upon ±1% resistance tolerances at 25°C. Derating is required for higher temperatures, closer tolerances and lower resistance values.

6 TERMINALS

Solderable "hot-tinned" copper wire leads act as an excellent wetting agent and provide long shelf life. Low EMF construction reduces thermal effects. Select any two terminals as current leads (directly or diagonally opposite) and the other two potential leads for voltage drop.

7 TWO TERMINALS VS. FOUR TERMINALS

Two-wire devices are for relatively high values where the effects of lead-out resistance and contact resistance are minimal. Allow approx. +.001 ohm per inch for lead-out resistance on 2-wire designs. Adder may be eliminated by using a 4-terminal resistor for very accurate, repeatable low resistance measurements.

Four-wire circuits will only indicate the voltage drop across the resistor eliminating lead-out and lead-heating errors.

Derating: AL-ER chassis mount resistors have an operating temperature range of −55°C to +275°C. For higher ambient temperatures, use derating curve which applies to operation of unmounted resistors (A = AL5ER and AL10ER, B = AL25ER and C = AL50ER).

Tolerance: ±1% is standard.

Temperature Coefficient of Resistance: Standard T.C.: ±20 PPM/°C = 20Ω and up, ±50 PPM/°C = 1Ω to 19.6Ω, ±100 PPM/°C = below 1Ω.

Dimensional Specifications: Identical to AL Series on previous page.

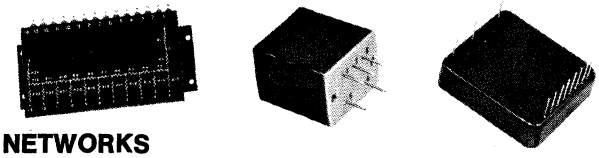
Discrete Resistor Networks and Matched Sets



NETWORKS

Network quality is determined by the qualities of its individual resistors and the packaging and mounting expertise of its assembler. RCL/Shallcross offers a unique background of experience, data, manufacturing and testing skills for its wirewound resistor networks. PARAMETERS: (1) Resistance ratios to .001%, (2) Resistor tolerances to ±.005% (at ambient), (3) Ratio tolerances as close as .01% (over a range of temperatures), (4) Stability to ±.001% per year.

MATCHED SETS

Two or more resistors can be matched with relative tolerance much higher than each one's individual tolerance. Characteristics most often matched are: (1) DC Resistance at one or more temperatures, (2) AC and DC Voltage ratios, (3) Temperate Coefficients and (4) Phase Shifts. Principle advantages of matched sets are: (a) Very tight relative tolerances, (b) Lower cost than networks of comparable accuracy and (c) Flexibility in locating components during design and packaging. An engineering staff at RCL/Shallcross is ready to assist you in specifying your matched set requirements.

Molded Temperature Sensors

RCL offers a standard line of epoxy encapsulated sensing resistors for temperature compensating applications. The standard resistance tolerance ±5% with tighter tolerances available on special order. Cable lengths from 2.0" to 48.0" (50.80 to 1219.2 mm) are available with 6.0" (152.40 mm) standard. Operating temperature range is −55°C to +105°C. Repeatability of tempco within a given lot is ±100 PPM.

RCL Style	Resistance Range	PPM/°C Average Tempco 0°C — 100°C
TC35	10Ω — 50KΩ	3500 ±350
TC45	10Ω — 10KΩ	4500 ±450

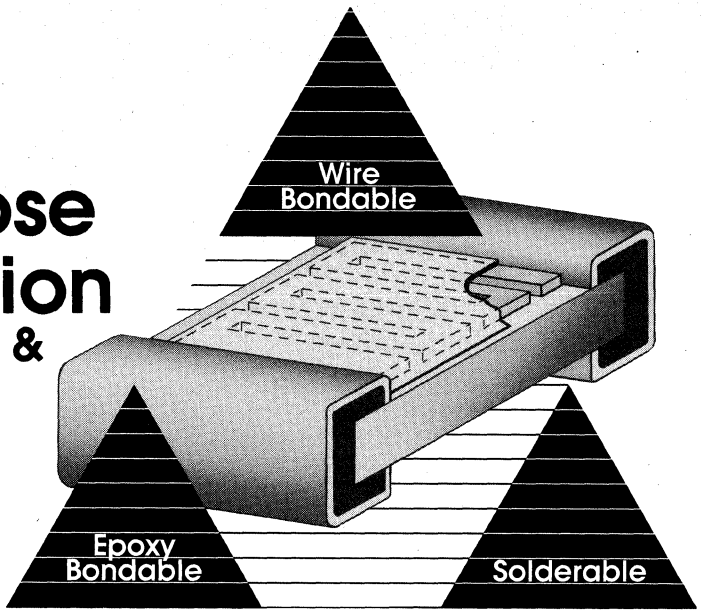
All Purpose Termination

Precision Thick & Thin Film Chip Resistors



Meets or Exceeds MIL-R-55342 Characteristic "E"

The all-purpose terminations on Ohmtek precision wraparound resistor chips accept all three types of mounting — solder mount, conductive epoxy or gold wire bonding. Low noise, superior stability, low TCR and low voltage coefficient guarantee that Ohmtek chips meet the exacting standards of your applications. **Construction consists of gold plating over an electroplated nickel barrier.**
